### Definitions for Abbreviation and Symbols Used In This Test Report

“EUT” means Equipment Under the Test.

“AE” means Associated Equipment.

“N/A” means that Not Applicable.

“N/T” means that Not Tested.

☒ indicates that the listed condition, standard or equipment is applicable for this report.

☐ indicates that the listed condition, standard or equipment is not applicable for this report.

## 6 Preliminary Test and Test Setup

### 6.1 Channel Separation

The EUT have its hopping function enabled.

Use the following spectrum analyzer settings:

Span = wide enough to capture the peaks of two adjacent channels

Resolution (or IF) Bandwidth (RBW)  $\geq 1\%$  of the span

Video (or Average) Bandwidth (VBW)  $\geq$  RBW

Sweep = auto

Detector function = peak

Trace = max hold

Allow the trace to stabilize. Use the marker-delta function to determine the separation between the peaks of the adjacent channels.

### 6.2 Minimum Hopping Channel

The EUT have its hopping function enabled.

Use the following spectrum analyzer settings:

Span = the frequency band of operation

RBW  $\geq 1\%$  of the span

VBW  $\geq$  RBW

Sweep = auto

Detector function = peak

Trace = max hold

Allow the trace to stabilize. It may prove necessary to break the span up to sections, in order to clearly show all of the hopping frequencies.

Measurement setup is same as sub-clause 6.1.

### 6.3 Occupied Bandwidth

Use the following spectrum analyzer settings:

Span = approximately 2 to 3 times the 6 dB or 20 dB bandwidth, centered on a channel

RBW  $\geq$  1% of the 6 dB or 20 dB bandwidth

VBW  $\geq$  RBW

Sweep = auto

Detector function = peak

Trace = max hold

The EUT should be transmitting at its maximum data rate. Allow the trace to stabilize. Use the marker-to-peak function to set the marker to the peak of the emission. Use the marker-delta function to measure 6 dB or 20 dB down one side of the emission. Reset the marker-delta function, and move the marker to the other side of the emission, until it is (as close as possible to) even with the reference marker level. The marker-delta reading at this point is the 6 dB or 20 dB bandwidth of the emission. If this value varies with different modes of operation (e.g., data rate, modulation format, etc.), repeat this test for each variation.

Measurement setup is same as sub-clause 6.1.

### 6.4 Dwell Time

The EUT must have its hopping function enabled.

Use the following spectrum analyzer settings:

Span = zero span, centered on a hopping channel

RBW  $\leq$  Channel Separation

VBW  $\geq$  RBW

Sweep = as necessary to capture the entire dwell time per hopping channel

Detector function = peak

Trace = max hold

If possible, use the marker-delta function to determine the dwell time. If this value varies with different modes of operation (e.g., data rate, modulation format, etc.), repeat this test for each variation.

Measurement setup is same as sub-clause 6.1.

## 6.5 Peak Output Power (Conduction)

In case of conducted measurements, the transmitter shall be connected to the measuring equipment via a suitable attenuator.

The measurement shall be performed using normal operation of the equipment with the test modulation applied.

It is measured the Peak Power Analyzer, that have had the RBW greater than 6 dB bandwidth of the emission.

The test procedure shall be as follows;

- using a suitable means, the output of the transmitter shall be connected to the peak power analyzer;
- the peak power analyzer is made into a suitable condition for the measurement;
- The observed value shall be recorded;

The measurement shall be repeated at the lowest, the middle, and the highest frequency of the stated frequency range.

## 6.6 Peak Power Density (Conduction)

Use the following spectrum analyzer settings:

Span = approximately 5 times the 20 dB bandwidth, centered on a channel

RBW = Specified Value

VBW  $\geq$  RBW

Sweep = auto

Detector function = peak

Trace = max hold

Allow the trace to stabilize. Use the marker-to-peak function to set the marker to the peak of the emission.

Measurement setup is same as sub-clause 6.1.

## 6.7 Peak Output Power and Peak Power Density (Radiation)

The radiated power output and the field strength of the transmitter radiation were measured at the distance at 3 meters away from the transmitter under test which was placed on a turntable 0.8 meter in height. The receiving antenna was oriented for vertical polarization and raised or lowered through 1 to 4 meters until the maximum signal level was detected on the measuring instrument. The transmitter under test was rotated through 360° until the maximum signal was received. The measurement was repeated with the receiving antenna in the horizontal polarization.

The transmitter was removed and replaced with the antenna. The center of the antenna was placed approximately at the same location as the center of the transmitter. The antenna was fed with a signal generator, and the output level of the signal generator was adjusted to obtain the previously recorded maximum reading at the particular frequency and recorded. This procedure was repeated with the receiving antenna and the antenna in the orthogonal polarization.

The input power into the antenna was measured using the power meter. The level of the emissions in dBm(EIRP) were calculated from the following formula:

$$\text{Transmitter Power[dBm]}(\text{EIRP}) = (\text{Meter Reading of Power Meter}) + (\text{Antenna Gain[dBi]})$$

Use the following spectrum analyzer settings:

Span = approximately 5 times the 20 dB bandwidth, centered on a channel

RBW : Greater than the 20 dB bandwidth of the emission being measured or Specified Value

VBW ≥ RBW

Sweep = auto

Detector function = peak

Trace = max hold

Allow the trace to stabilize. Use the marker-to-peak function to set the marker to the peak of the emission.

## 6.8 Spurious Emission (Conduction)

### Band-edge Compliance of RF Conducted Emissions

Use the following spectrum analyzer settings:

Span = wide enough to capture the peak level of the emission operating on the channel closest to the band edge, as well as any modulation products which fall outside of the authorized band of operation

RBW  $\geq$  1% of the span

VBW  $\geq$  RBW

Sweep = auto

Detector function = peak

Trace = max hold

Allow the trace to stabilize. Set the marker on the emission at the band edge, or on the highest modulation product outside of the band, if this level is greater than that at the band edge. Enable the marker-delta function, then use the marker-to-peak function to move the marker to the peak of the in-band emission.

Now, using the same instrument settings, enable the hopping function of the EUT. Allow the trace to stabilize. Follow the same procedure listed above to determine if any spurious emissions caused by the hopping function also comply with the specified limit.

### Spurious RF Conducted Emissions

Use the following spectrum analyzer settings:

Span = wide enough to capture the peak level of the in-band emission and all spurious emissions (e.g., harmonics) from the lowest frequency generated in the EUT up through the 10th harmonic. Typically, several plots are required to cover this entire span.

RBW = 100 kHz

VBW  $\geq$  RBW

Sweep = auto

Detector function = peak

Trace = max hold

Allow the trace to stabilize. Set the marker on the peak of any spurious emission recorded. The level displayed must comply with the limit specified in this Section.

Measurement setup is same as sub-clause 6.1.

## 6.9 Spurious Emissions (Radiation)

### 6.9.1 Radiated Emission ( 9 kHz – 30 MHz)

According to description of ANSI C63.4-2003 sec.13.1.4, the preliminary radiated emissions measurement were carried out. The preliminary radiated measurements were performed at the measurement distance that specified for compliance to determine the emission characteristics of the EUT.

The EUT configuration, cable configuration and mode of operation were determined for producing the maximum level of emissions. These configurations were used for the final radiated emissions measurements.

## 6.9.2 Radiated Emission (30 MHz – 1000 MHz)

According to description of ANSI C63.4-2003 sec.13.1.4, the preliminary radiated emissions measurement were carried out. The preliminary radiated measurements were performed at the measurement distance that specified for compliance to determine the emission characteristics of the EUT.

The EUT configuration (in X, Y and Z axis), cable configuration and mode of operation were determined for producing the maximum level of emissions. These configurations were used for the final radiated emissions measurements.

### 6.9.3 Radiated Emission (above 1 GHz)

According to description of ANSI C63.4-2003 sec.13.1.4, the preliminary radiated emissions measurement were carried out. The preliminary radiated measurements were performed at the measurement distance that specified for compliance to determine the emission characteristics of the EUT.

The EUT configuration (in X, Y and Z axis), cable configuration and mode of operation were determined for producing the maximum level of emissions. These configurations were used for the final radiated emissions measurements.

## 6.10 AC Power Line Conducted Emissions (150 kHz – 30 MHz)

According to description of ANSI C63.4-2003 sec.13.1.3, the AC power line preliminary conducted emissions measurements were carried out.

The preliminary conducted measurements were performed using the spectrum analyzer to observe the emission characteristics of the EUT.

The EUT configuration, cable configuration and mode of operation were determined for producing the maximum level of emissions. These configurations were used for final AC power line conducted emissions measurements.

**11 Summary****General Remarks**

The EUT was tested according to the requirements of CFR 47 FCC Rules and Regulations Part 15 and RSS-210 under the test configuration, as shown in clause 12 to 14.

The conclusion for the test items of which are required by the applied regulation is indicated under the test result.

**Test Result :**

The "as received" sample;

- ☒-fulfill the test requirements of the regulation mentioned on clause 1.  
☐-doesn't fulfill the test requirements of the regulation mentioned on clause 1.

## 12 Operating Condition

Power Supply Voltage : 13.2 VDC operate with Car Battery

### Operation Mode

The EUT is set with the test mode, the specification of the test mode is as following.

- (1) TX Mode ( 0ch : 2402MHz)
- (2) TX Mode (39ch : 2441MHz)
- (3) TX Mode (78ch : 2480MHz)
- (4) TX Mode (Hopping)
- (5) RX Mode

Used application to controlled : Blue Test (The detail is as follows.)

The setting other than a default setting is shown as follows.

Transport type : BCSP

Serial port : com6

Baud rate : 115200

Frequency : 2402 MHz, 2441 MHz, 2480 MHz and Hopping

Packet Condition : DH1, DH3 and DH5

Power set of TX mode : 0(Ext.) and 40 or 42(Int.)

Fundamental Frequency : The details of fundamental frequency are shown the table in next  
Generated/used in the EUT page.

Highest Frequencies : 4.48 – 4.97 GHz (the part of Unintentional Radiators)  
2.4 GHz (the part of Intentional Radiators)

## Appendix A : Test Data

### A.1 Channel Separation

Date : September 10, 2008  
 Temp. : 25 °C Humi. : 45 %

Mode of EUT : TX Mode (Hopping)

Test Port : Temporary antenna connector

Channel Separation (kHz)	Limit
1004.008	25 kHz or 20 dB bandwidth of hopping channel(*)

Note : (\*) It means that there is an alternative limit, in the case of frequency hopping systems operating in the 2400 - 2483.5 MHz band with an output power no greater than 125mW.

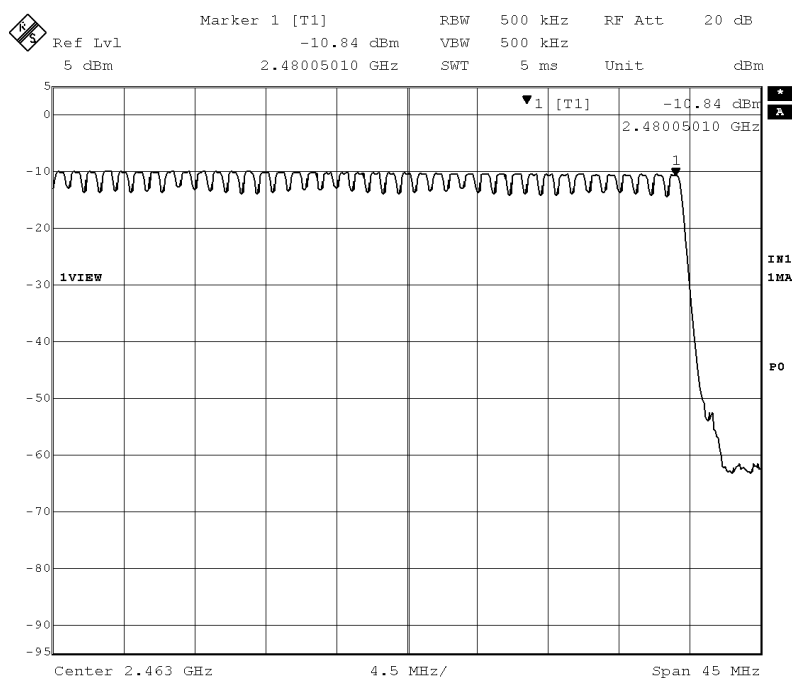

## A.2 Minimum Hopping Channel

Date : September 10, 2008  
 Temp. : 25 °C Humi. : 45 %

Mode of EUT : TX Mode (Hopping)  
 Test Port : Temporary antenna connector

Hopping Channel	Limit
79	15

## A.3 Occupied Bandwidth

Date : September 10, 2008  
 Temp. : 25 °C Humi. : 45 %

### (1) 20dB Bandwidth

Mode of EUT : TX Mode (0ch : 2402MHz)

Test Port : Temporary antenna connector

Bandwidth (kHz)	Limit (kHz)
933.9	N/A

Mode of EUT : TX Mode (39ch : 2441MHz)

Test Port : Temporary antenna connector

Bandwidth (kHz)	Limit (kHz)
933.9	N/A

Mode of EUT : TX Mode (78ch : 2480MHz)

Test Port : Temporary antenna connector

Bandwidth (kHz)	Limit (kHz)
937.9	N/A

## (2) 99% Bandwidth

Mode of EUT : TX Mode (0ch : 2402MHz)

Test Port : Temporary antenna connector

Bandwidth (kHz)	Limit (kHz)
853.7	N/A

Mode of EUT : TX Mode (39ch : 2441MHz)

Test Port : Temporary antenna connector

Bandwidth (kHz)	Limit (kHz)
853.7	N/A

Mode of EUT : TX Mode (78ch : 2480MHz)

Test Port : Temporary antenna connector

Bandwidth (kHz)	Limit (kHz)
857.7	N/A

## A.4 Dwell Time

Date : September 10, 2008  
 Temp. : 25 °C Humi. : 45 %

Mode of EUT : TX Mode (Hopping)  
 Packet Setting : DH1  
 Test Port : Temporary antenna connector

Dwell Time (ms)	Limit
134.9	400 ms per 31.6 seconds

Note : The system makes worst case 1600 hops per second or 1 time slot has a length of 625  $\mu$ s with 79 channels. A DH1 Packet need 1 time slot for transmitting and 1 time slot for receiving. Then the system makes worst case 800 hops per second with 79 channels. So the system has each channel 10.1266 times per second and so for 31.6 seconds the system have 320.0 times of appearance.

Each tx-time per appearance is 0.4217 ms.

Dwell time = 320.0 \* 0.4217 = 134.9 ms

Mode of EUT : TX Mode (Hopping)

Packet Setting : DH3

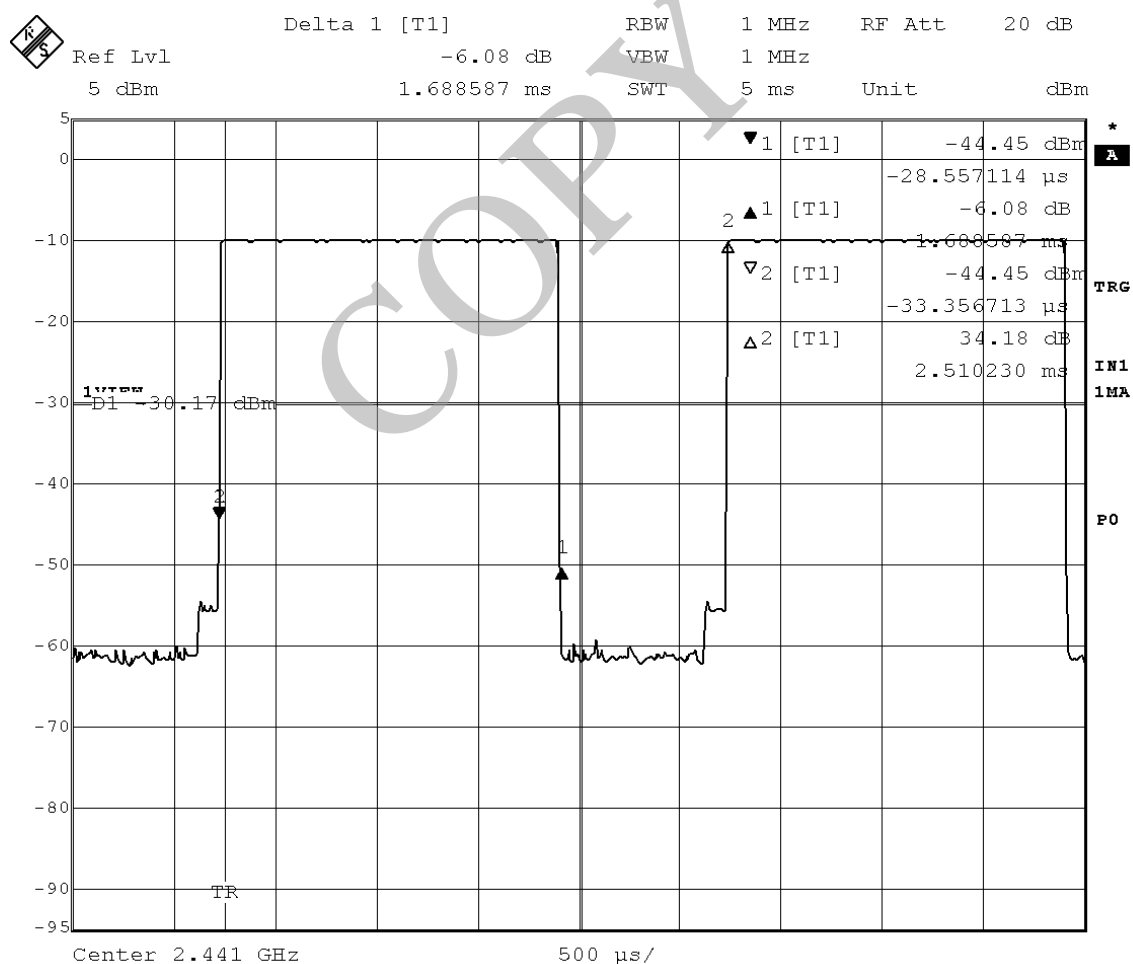

Test Port : Temporary antenna connector

Dwell Time (ms)	Limit
270.2	400 ms per 31.6 seconds

Note : A DH3 Packet need 3 time slot for transmitting and 1 time slot for receiving. Then the system makes worst case 400 hops per second with 79 channels. So the system have each channel 5.063 times per second and so for 31.6 seconds the system have 160.0 times of appearance.

Each tx-time per appearance is 1.689 ms.

Dwell time = 160.0 \* 1.689 = 270.2 ms

Mode of EUT : TX Mode (Hopping)

Packet Setting : DH5

Test Port : Temporary antenna connector

Dwell Time (ms)	Limit
317.4	400 ms per 31.6 seconds

Note : A DH5 Packet need 5 time slot for transmitting and 1 time slot for receiving. Then the system makes worst case 266.667 hops per second with 79 channels. So the system have each channel 3.3755 times per second and so for 31.6 seconds the system have 160.0 times of appearance.

Each tx-time per appearance is 2.973 ms.

Dwell time = 106.7 \* 2.973 = 317.2 ms

#### A.5 Peak Output Power (Conduction)

Date : September 10, 2008  
 Temp. : 25 °C Humi. : 45 %

Mode of EUT : TX Mode
