#### **Forward**

The following information is submitted for consideration in obtaining Grant of Certification for a license exempt low power intentional radiator operating under CFR47 Paragraph 15.249 and Industry Canada Spectrum Management and Telecommunications Radio Standard Specification RSS-210, Issue 8.

Name of Applicant: Garmin International, Inc.

1200 East 151st Street Olathe, KS 66062

Models: Area 795 and Area 796

FCC I.D.: IPH-01824, IC: 1792A-01824, Frequency Range: 2402 - 2480 MHz

Operating Power: Peak emission of 93.3 dBµV/m and average emission of 93.0 dBµV/m

(3 meter radiated measurement), 99% Occupied Bandwidth 945.51 kHz,

Receiver worst-case emission 41.4 dBμV/m

#### **Applicable Standards & Procedures**

In accordance with the Federal Communications Code of Federal Regulations, dated October 1, 2010, Part 2, Subpart J, Paragraphs 2.907, 2.911, 2.913, 2.925, 2.926, 2.1031 through 2.1057, and applicable parts of paragraph 15, Part 15C Paragraph 15.249, and Industry Canada Spectrum Management and Telecommunications Radio Standard Specification RSS-210, Issue 8 the following information is submitted. Test procedures used are the established Methods of Measurement of Radio-Noise Emissions as described in the ANSI C63.4-2009, RSS-210, and appropriate FCC documents DA00-1407 and DA00-705 and/or TIA/EIA 603-1.

#### **Opinion / Interpretation of Results**

Test Performed	Minimum Margin (dB)	Results
Antenna requirement per CFR 47 15.203	N/A	Complies
Restricted Bands Emissions as per CFR 47 15.205 and RSS-210 2.2	-12.7	Complies
AC Line Conducted Emissions as per CFR 47 15.207 and RSS-210 2.5	-15.7	Complies
Radiated Emissions as per CFR 47 15.209 and RSS-210 2.5	-5.4	Complies
Radiated Emissions per CFR 47 15.249 and RSS-210 A2.9	-1.0	Complies
Receivers emissions per CFR 47 15.111 and RSS-210 and RSS-GEN	-12.6	Complies

Rogers Labs, Inc. 4405 West 259<sup>th</sup> Terrace Louisburg, KS 66053 Phone/Fax: (913) 837-3214

Revision 1

Garmin International, Inc.
Models: Area 795, Area 796
Test #:110505 SN: ENG1
Test to: FCC Parts 2 and 15.249, RSS-210

#### Application for Certification

(1) Manufacturer: Garmin International, Inc.

> 1200 East 151st Street Olathe, KS 66062

(2) Identification: Models: Area 795 and Area 796

> FCC I D · IPH-01824 IC: 1792A-01824

- (3) Instruction Book: Refer to Exhibit for Instruction Manual.
- **(4)** Description of Circuit Functions: Refer to Exhibit of Operational Description.
- Block Diagram with Frequencies: Refer to Exhibit of Operational Description. (5)
- (6) Report of Measurements: Report of measurements follows in this Report.
- Photographs: Construction, Component Placement, etc.: Refer to Exhibit for photographs of (7) equipment.
- (8) Peripheral equipment or accessories for the equipment. Optional equipment available for the EUT includes AC power supply or DC cigarette adapters for battery recharge, vehicle mounts, and USB cable for computer interface and connection to AC power adapter. The available configuration options were investigated for this and other reports in compliance with required standards with worst-case data presented.
- (9) Transition Provisions of 15.37 are not being requested.
- (10)Equipment is not a scanning receiver and this section is not applicable.
- The equipment does not operate in the 59 64 GHz frequency band and this section is (11)not applicable.
- (12)The equipment is not software defined and this section is not applicable.

#### Statement of Modifications and Deviations

No modifications to the EUT were required for the equipment to demonstrate compliance with CFR47 Part 15C, or RSS-210 Emission Requirements. There were no deviations or modification to the specifications.

#### **Equipment Function and Testing Procedures**

The EUT is a GPS receiver and display unit offering reception and display of location, navigation, and other information for the user incorporating a low power transmitter with operation capability in the 2402-2480 MHz frequency band (CFR 47 15.249 and RSS-210). The GPS design offers use as a hand-held, transportation mount or portable configuration for use in navigational applications. The equipment offers communications to other 2402-2480 MHz compliant devices. Two samples were supplied for testing one production design and the other modified for testing purposes replacing integral antenna with RF connection port for this and other reports and documentation. This modification offered testing facility ability to connect transmitter antenna port to test equipment for transmitter antenna port conducted emissions testing. The EUT was arranged as typical user equipment configurations for testing purposes. The transmitter offers no other interface connections than those in the configuration options shown above. The unit operates from internal battery or external power received from external power supply options as shown in the configuration diagrams above. Some configurations shown above are not applicable for this report and have been tested and documented in other relevant documentation. As requested by the manufacturer and required by regulations, the equipment was tested for emissions compliance using the available configurations with the worst-case data presented. Test results in this report relate only to the products described in this report.

Rogers Labs, Inc. 4405 West 259<sup>th</sup> Terrace Louisburg, KS 66053 Phone/Fax: (913) 837-3214

#### AC Line Conducted Emission Test Procedure

Testing for the AC line-conducted emissions was performed as defined in sections 7.2.4 and 13 of ANSI C63.4-2009. The test setup, including the EUT, was arranged in the test configurations as shown above during testing. The test configuration was placed on a 1 x 1.5-meter wooden bench, 0.8 meters high located in a screen room. The power lines of the system were isolated from the power source using a standard LISN with a 50- $\mu$ Hy choke. EMI was coupled to the spectrum analyzer through a 0.1  $\mu$ F capacitor internal to the LISN. The LISN was positioned on the floor beneath the wooden bench supporting the EUT. The power lines and cables were draped over the back edge of the table. Refer to photographs in exhibits for EUT placement used during testing.

#### Radiated Emission Test Procedure

Testing for the radiated emissions was performed as defined in sections 8.3 and 13.1 of ANSI C63.4-2009. Emissions testing was performed covering the frequency band of 32 kHz to 25 GHz. The EUT was arranged in the test configurations as shown above during testing. The test configuration was placed on a rotating 1 x 1.5-meter wooden platform 0.8 meters above the ground plane at a distance of 3 meters from the FSM antenna. EMI energy was maximized by equipment placement, raising and lowering the FSM antenna, changing the antenna polarization, and by rotating the turntable. Each emission was maximized before final data was taken using a spectrum analyzer. Refer to photographs in exhibits for EUT placement used during testing.

#### **Environmental Conditions**

Ambient Temperature 22.2° C Relative Humidity 38%

Atmospheric Pressure 1009.3 mb

#### **Units of Measurements**

Conducted EMI Data is in dBµV; dB referenced to one microvolt.

Radiated EMI Data is in dBµV/m; dB/m referenced to one microvolt per meter.

#### **Test Site Locations**

Conducted EMI The AC power line conducted emissions testing performed in a shielded

screen room located at Rogers Labs, Inc., 4405 W. 259th Terrace,

Louisburg, KS.

Radiated EMI The radiated emissions tests were performed at the 3 meters, Open Area

Test Site (OATS) located at Rogers Labs, Inc., 4405 W. 259<sup>th</sup> Terrace,

Louisburg, KS.

Site Registration Refer to Annex for FCC Site Registration Letter, # 90910, and Industry

Canada Site Registration Letter, IC3041A-1.

#### **List of Test Equipment**

A Rohde & Schwarz ESU40 and/or Hewlett Packard 8591EM Spectrum Analyzer was used as the measuring device for the emissions testing of frequencies below 1 GHz. A Rohde & Schwarz ESU40 and/or Hewlett Packard 8562A Spectrum Analyzer was used as the measuring device for testing the emissions at frequencies above 1 GHz. The analyzer settings used are described in the following table. Refer to the appendix for a complete list of test equipment.

Analyzer Settings									
	AC Line Conducted Emissions:								
RBW	AVG. BW	Detector Function							
9 kHz	30 kHz	Peak/Quasi Peak

#### **General Emissions (Unintentional Radiators)**

#### AC Line Conducted EMI Procedure

The EUT was arranged in typical equipment configurations as offered by manufacturer. Testing was performed with the EUT placed on a 1 x 1.5-meter wooden bench 80 cm above the conducting ground plane, floor of a screen room. The bench was positioned 40 cm away from the wall of the screen room. The LISN was positioned on the floor of the screen room 80-cm from the rear of the EUT. Testing for the line-conducted emissions were the procedures of ANSI C63.4-2009 paragraphs 13.1.3 and 7.2.4. The AC adapter for the EUT or CPU was connected to the LISN for line-conducted emissions testing. A second LISN was positioned on the floor of the screen room 80cm from the rear of the supporting equipment of the EUT. All power cords except the EUT were then powered from the second LISN. EMI was coupled to the spectrum analyzer through a 0.1 µF capacitor, internal to the LISN. Power line conducted emissions testing was carried out individually for each current carrying conductor of the EUT. The excess length of lead between the system and the LISN receptacle was folded back and forth to form a bundle not exceeding 40 cm in length. The screen room, conducting ground plane, analyzer, and LISN were bonded together to the protective earth ground. Preliminary testing was performed to identify the frequencies of each of the emissions, which demonstrated the highest amplitudes. The cables were repositioned to obtain maximum amplitude of measured EMI level. Once the worst-case configuration was identified, plots were made of the EMI from 0.15 MHz to 30 MHz then data was recorded with maximum conducted emissions levels. Refer to figures one and two showing plots of the worst-case AC Line conducted emissions of the AC Adapter while charging the EUT and interfaced to computer through USB cable.

2	27.000000000	MHz	31.28	Average	-18.72

Other emissions present had amplitudes at least 20 dB below the limit.

#### Summary of Results for AC Line Conducted Emissions

The EUT demonstrated compliance with the AC Line Conducted Emissions requirements of CFR 47 Part 15B, RSS-GEN, and other applicable standards. The EUT worst-case configuration demonstrated a minimum margin of -15.7 dB below the limit. Other emissions were present with amplitudes at least 20 dB below the limit and worst-case amplitudes recorded.

#### Radiated EMI

The EUT was arranged in typical equipment configurations and operated through all various modes. Preliminary testing was performed in a screen room with the EUT positioned 1 meter from the FSM. Radiated emissions measurements were performed to identify the frequencies, which produced the highest emissions. Plots were made of the worst-case radiated frequency spectrum from 30 MHz to 25,000 MHz for the preliminary testing. Refer to figures three through nine showing plots of the worst-case radiated emissions spectrum taken in the screen room. Each radiated emission was then re-maximized at the OATS location before final radiated emissions measurements were performed. Final data was taken with the EUT located at the OATS at a distance of 3 meters between the EUT and the receiving antenna. The frequency spectrum from 30 MHz to 25,000 MHz was searched for radiated emissions. Measured emission levels were maximized by EUT placement on the table, rotating the turntable through 360 degrees, varying the antenna height between 1 and 4 meters above the ground plane and changing antenna position between horizontal and vertical polarization. Antennas used were Biconilog from 30 to 1,000 MHz, and/or Log Periodic from 200 MHz to 1 GHz, Double Ridge Horn or pyramidal horns and mixers from 1 GHz to 25 GHz, notch filters and appropriate amplifiers were utilized.

Summary of Results for Radiated Emissions

The EUT demonstrated compliance with requirements of CFR47, and Industry Canada

requirements. The EUT demonstrated a minimum margin of -5.4 dB below requirements. Other

emissions were present with amplitudes at least 20 dB below the limit.

**Intentional Radiators Emissions** 

As per CFR47 Part 15, Subpart C, paragraphs 15.203, 15.205, 15.209, 15.249 and RSS-210 the

following information is submitted.

Antenna Requirements

The unit is produced with a permanently attached transmitter antenna and has no provision for user

service, replacement, or antenna modification. The requirements for unique antenna are fulfilled

and there are no deviations or exceptions to the specification.

Restricted Bands of Operation

Spurious emissions falling in the restricted frequency bands of operation were measured at a

distance of three meters at the OATS. The EUT utilizes frequency, determining circuitry, which

generates harmonics falling in the restricted bands. Emissions were checked at the OATS, using

appropriate antennas or pyramidal horns, amplification stages, and a spectrum analyzer. No other

significant emission was observed which fell into the restricted bands of operation.

Sample Calculation:

RFS  $(dB\mu V/m @ 3m) = FSM (dB\mu V) + Antenna Factor (dB/m) - Amplifier Gain (dB)$ 

Revision 1

Other emissions present had amplitudes at least 20 dB below the margin.

#### Summary of Results for Radiated Emissions in Restricted Bands

The EUT demonstrated compliance with requirements of CFR47 15C, and Industry Canada RSS-210 requirements. The EUT demonstrated a minimum margin of -5.4 dB below requirements. Peak and Quasi-peak amplitudes of frequencies below 1000 MHz were measured and average and peak amplitudes of frequencies above 1000 MHz were measured for demonstration of compliance with the regulations. No other significant emissions where found in the restricted frequency bands. Other emissions were present with amplitudes at least 20 dB below the FCC Limits.

#### Operation in the Band 2400 – 2483.5 MHz

The power output was measured on an Open Area Test Site at a 3 meters distance. The EUT was placed on a wooden turntable 0.8 meters above the ground plane at a distance of 3 meters from the FSM antenna. The peak and average amplitude of emissions above 1000 MHz including spurious emissions were measured using a spectrum analyzer/receiver. Data was then recorded from the analyzer display. Emissions radiated outside of the specified bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general radiated emission limits in 15.209 (and/or RSS-210), whichever is the lesser attenuation. The amplitude of each emission was maximized by varying the FSM antenna height, polarization, and by rotating the turntable. A Biconilog Antenna was used for measuring emissions from 30 to 1000 MHz, and/or Log Periodic Antenna for 200 to 1000 MHz, Double Ridge Horn or Pyramidal Horn Antennas from 1 GHz to 25 GHz. Emissions were measured in dB $\mu$ V/m @ 3 meters. Refer to figures ten through twenty-one showing the frequency and amplitude of emission displayed on the spectrum analyzer measured at the temporary test antenna port (performed on sample #2).

#### Summary of Results for Transmitter Radiated Emissions

The EUT demonstrated compliance with the requirements and specifications of CFR47 Part 15.249 and RSS-210 Intentional Radiators. The EUT demonstrated highest peak emission level of the fundamental of 93.3 dBµV/m with a minimum margin of -0.7 dB, and average emission of 93.0 dBuV/m with a minimum margin of -1.0 dB, as measured at 3 meters. The EUT demonstrated a minimum margin of -10.5 dB below limits for the harmonic emissions. There were no other measurable emissions greater than 20 dB below requirements than those recorded in this report. There are no deviations or exceptions to the requirements.

#### **Receiver Spurious Emissions**

Receivers which provide terminals for the connection of an external receiving antenna may be tested to demonstrate compliance with the antenna terminals shielded and terminated with a termination equal to the impedance specified for the antenna, provided these receivers also comply with the following: With the receiver antenna terminal connected to a resistive termination equal to the impedance specified or employed for the antenna, the power at the antenna terminal at any frequency within the range of measurements specified shall not exceed 2.0 nanowatts (-57 dBm). The EUT incorporates an integral antenna system in production equipment. A test sample was offered allowing connection to antenna port for antenna conducted emissions testing. The test antenna port was connected to a spectrum analyzer for testing the antenna-conducted emissions. Antenna port conduction testing was performed at temporary antenna test port connected to the spectrum analyzer through a short coaxial cable. The spectrum analyzer provided the 50-ohm load equivalent to the antenna. The frequency spectrum was investigated at the antenna port with the worst case data presented. Refer to figures twenty-two through twenty-seven showing the spectrum analyzer display of worst-case receiver antenna conduction emissions. Worst-case antenna port conducted emissions data presented. Worst-case (production design sample) receiver radiated emissions were tested at 3 meter OATS. Data presented below demonstrates compliance with regulations.

#### Summary of Results for Receiver Emissions

The EUT demonstrated compliance with the antenna conducted emissions requirements of CFR 47 Part 15B and RSS-GEN with an antenna port conducted minimum margin of -22.6 dB below requirements (measured at test ant port). The EUT demonstrated compliance with the radiated emissions requirements of CFR 47 Part 15B and RSS-GEN with a minimum -12.6 dB margin below requirements. Other emissions were present with amplitudes at least 20 dB below the CFR 47 and RSS-GEN limits.

#### Annex A Measurement Uncertainty Calculations

#### Radiated Emissions Measurement Uncertainty Calculation

Measurement of vertically polarized radiated field strength over the frequency range 30 MHz to 1 GHz on an open area test site at 3m and 10m includes following uncertainty:

	Probability	Uncertainty
Contribution	Distribution	(dB)
Antenna factor calibration	normal $(k = 2)$	$\pm 0.58$
Cable loss calibration	normal(k = 2)	$\pm 0.2$
Receiver specification	rectangular	±1.0
Antenna directivity	rectangular	$\pm 0.1$
Antenna factor variation with height	rectangular	$\pm 2.0$
Antenna factor frequency interpolation	rectangular	$\pm 0.1$
Measurement distance variation	rectangular	$\pm 0.2$
Site Imperfections	rectangular	±1.5
Combined standard uncertainte u (v) is	•	

Combined standard uncertainty  $u_c(y)$  is

$$U_c(y) = \pm \sqrt{\left[\frac{1.0}{2}\right]^2 + \left[\frac{0.2}{2}\right]^2 + \left[1.0^2 + 0.1^2 + 2.0^2 + 0.1^2 + 0.2^2 + 1.5^2\right]}$$

$$U_{c}(y) = \pm 1.6 \text{ dB}$$

It is probable that  $u_c(y) / s(q_k) > 3$ , where  $s(q_k)$  is estimated standard deviation from a sample of n readings unless the repeatability of the EUT is particularly poor, and a coverage factor of k = 2 will ensure that the level of confidence will be approximately 95%, therefore:

$$s(q_k) = \sqrt{\frac{1}{(n-1)} \sum_{k=1}^{n} (q_k - \bar{q})^2}$$

$$U = 2 U_c(y) = 2 x \pm 1.6 dB = \pm 3.2 dB$$

#### Notes:

- Uncertainties for the antenna and cable were estimated, based on a normal probability distribution with k = 2.
- 1.2 The receiver uncertainty was obtained from the manufacturer's specification for which a rectangular distribution was assumed.
- 1.3 The antenna factor uncertainty does not take account of antenna directivity.
- 1.4 The antenna factor varies with height and since the height was not always the same in use as when the antenna was calibrated an additional uncertainty is added.
- 1.5 The uncertainty in the measurement distance is relatively small but has some effect on the received signal strength. The increase in measurement distance as the antenna height is increased is an inevitable consequence of the test method and is therefore not considered a contribution to uncertainty.
- 1.6 Site imperfections are difficult to quantify but may include the following contributions:
  - -Unwanted reflections from adjacent objects.
  - -Ground plane imperfections: reflection coefficient, flatness, and edge effects.
  - -Losses or reflections from "transparent" cabins for the EUT or site coverings.
  - -Earth currents in antenna cable (mainly effect Biconical antennas).

Rogers Labs, Inc. 4405 West 259<sup>th</sup> Terrace Louisburg, KS 66053 Phone/Fax: (913) 837-3214

Revision 1

Garmin International, Inc.
Models: Area 795, Area 796
Test #:110505 SN: ENG1
Test to: FCC Parts 2 and 15.249, RSS-210
File: Area 79x TstRpt 110505

FCC ID#: IPH-01824 IC: 1792A-01824 Date: May 23, 2011 Page 35 of 40

The specified limits for the difference between measured site attenuation and the theoretical value ( $\pm$  4 dB) were not included in total since the measurement of site attenuation includes uncertainty contributions already allowed for in this budget, such as antenna factor.

#### Conducted Measurements Uncertainty Calculation

Measurement of conducted emissions over the frequency range 9 kHz to 30 MHz includes following uncertainty:

Probability	Uncertainty
Distribution	(dB)
rectangular	±1.5
rectangular	±1.5
normal (k=2)	±0.5
	Distribution rectangular rectangular

Combined standard uncertainty  $u_c(y)$  is

$$U_c(y) = \pm \sqrt{\left[\frac{0.5}{2}\right]^2 + \frac{1.5^2 + 1.5^2}{3}}$$

$$U_c(y) = \pm 1.2 \text{ dB}$$

As with radiated field strength uncertainty, it is probable that  $u_c(y) / s(q_k) > 3$  and a coverage factor of k = 2 will suffice, therefore:

$$U = 2 U_c(y) = 2 x \pm 1.2 dB = \pm 2.4 dB$$

Annex C Rogers Qualifications

Scot D. Rogers, Engineer

Rogers Labs, Inc.

Mr. Rogers has approximately 17 years experience in the field of electronics. Work experience includes six years working in the automated controls industry and remaining years working with

the design, development and testing of radio communications and electronic equipment.

Positions Held:

Systems Engineer:

A/C Controls Mfg. Co., Inc. 6 Years

Electrical Engineer:

Rogers Consulting Labs, Inc. 5 Years

Electrical Engineer:

Rogers Labs, Inc. Current

Educational Background:

1) Bachelor of Science Degree in Electrical Engineering from Kansas State University

2) Bachelor of Science Degree in Business Administration Kansas State University

3) Several Specialized Training courses and seminars pertaining to Microprocessors and

Software programming.

#### Annex D FCC Test Site Registration Letter

#### FEDERAL COMMUNICATIONS COMMISSION

Laboratory Division 7435 Oakland Mills Road Columbia, MD 21046

May 18, 2010

Registration Number: 90910

Rogers Labs, Inc. 4405 West 259th Terrace, Louisburg, KS 66053

Attention:

Scot Rogers,

Re:

Measurement facility located at Louisburg

3 & 10 meter site

Date of Renewal: May 18, 2010

#### Dear Sir or Madam:

Your request for renewal of the registration of the subject measurement facility has been received. The information submitted has been placed in your file and the registration has been renewed. The name of your organization will remain on the list of facilities whose measurement data will be accepted in conjunction with applications for Certification under Parts 15 or 18 of the Commission's Rules. Please note that the file must be updated for any changes made to the facility and the registration must be renewed at least every three years.

Measurement facilities that have indicated that they are available to the public to perform measurement services on a fee basis may be found on the FCC website <a href="www.fcc.gov">www.fcc.gov</a> under E-Filing, OET Equipment Authorization Electronic Filing, Test Firms.

#### Annex E Industry Canada Test Site Registration Letter

Industry Canada Industrie Canada

May 26, 2010

OUR FILE: 46405-3041 Submission No: 140719

Rogers Labs Inc. 4405 West 259<sup>th</sup> Terrace Louisburg, KY, 66053 USA

Attention: Mr. Scot D. Rogers

Dear Sir/Madame:

The Bureau has received your application for the renewal of a 3/10m OATS. Be advised that the information received was satisfactory to Industry Canada. The following number(s) is now associated to the site(s) for which registration / renewal was sought (3041A-1). Please reference the appropriate site number in the body of test reports containing measurements performed on the site. In addition, please keep for your records the following information;

- Your primary code is: 3041
- The company number associated to the site(s) located at the above address is: 3041A

Furthermore, to obtain or renew a unique site number, the applicant shall demonstrate that the site has been accredited to ANSI C63.4-2003 or later. A scope of accreditation indicating the accreditation by a recognized accreditation body to ANSI C63.4-2003 or later shall be accepted. Please indicate in a letter the previous assigned site number if applicable and the type of site (example: 3 metre OATS or 3 metre chamber). If the test facility is not accredited to ANSI C63.4-2003 or later, the test facility shall submit test data demonstrating full compliance with the ANSI standard. The Bureau will evaluate the filing to determine if recognition shall be granted.

The frequency for re-validation of the test site and the information that is required to be filed or retained by the testing party shall comply with the requirements established by the accrediting organization. However, in all cases, test site re-validation shall occur on an interval not to exceed two years. There is no fee or form associated with an OATS filing. OATS submissions are encouraged to be submitted electronically to the Bureau using the following URL;

http://strategis.ic.gc.ca/epic/internet/inceb-bhst.nsf/en/h tt00052e.html.

If you have any questions, you may contact the Bureau by e-mail at <u>certification.bureau@ic.gc.ca</u> Please reference our file and submission number above for all correspondence.

Yours sincerely,

Dalwinder Gill
