System Description

The M3AONR00 is a ship borne marine radar designed to provide bearing and distance of ships in land targets in the vicinity from the ship. The radar unit is integrated into a full Marine system installation, including the chart plotter for display purposes. As the radar sweeps through 360°, reflected signals are displayed on the chart plotter as indications of hazards.

Application for Certification

- (1) Manufacturer: Garmin International, Inc. 1200 East 151st Street, Olathe, KS 66062
- (2) Identification: Model: M3AONR00 FCC ID: IPH-02356 IC: 1792A-02356
- (3) Instruction Book: Refer to exhibit for Draft Manual
- (4) Emission Type: Emissions designator 15M3PON
- (5) Frequency Range: 9300-9500 MHz, 9400 MHz \pm 30 MHz (typical)
- (6) Operating Power Level: 4000 Watt peak power, Maximum average power = 5 Watts EIRP
- (7) Maximum Power: 80.215, 20.0 Watts EIRP as listed on license.
- (8) Power into final amplifier(Peak magnetron anode) : 4,000 Vdc @ 3.0 A maximum = 12,000 watts peak power at magnetron, 4,000 watts mean peak output power
 4 kW peak transmitter power, calculated averages
 70 ns pulse = 1.4 Watts average
 150 ns pulse = 3.1 Watts average
 250 ns pulse = 3.6 Watts average
 800 ns pulse = 4.1 Watts average
 1000 ns pulse = 5.1 Watts average
- (9) Tune Up Procedure for Output Power: Refer to Exhibit for Alignment Procedure.
- (10) Circuit Diagrams: description of circuits, frequency stability, spurious suppression, and power and modulation limiting: Refer to Exhibit for Circuit Diagrams and theory of Operation.
- (11) Photograph or drawing of the Identification Plate: Refer to Exhibit for Photograph or Drawing.
- (12) Drawings of Construction and Layout: Refer to Exhibit for Drawings of Components Layout and Chassis Drawings.
- (13) Detail Description of Digital Modulation: Refer to Operational Description exhibit for description of modulation.
- (14) Data required by CFR47 paragraphs 2.1046 through 2.1057 are contained in this report.
- (15) External power amplifier requirements do not apply to this device or application.
- (16) AM broadcast requirements do not apply to this device or application.
- (17) Requirements of CFR47 paragraph 25.129 do not apply to this device or application.
- (18) The device is not a software-defined radio and requirements of 2.944 do not apply to this application.

List of Test Equipment

A Rohde and Schwarz ESU40 and/or Hewlett Packard 8591EM was used as the measuring device for the emissions testing of frequencies below 1 GHz. A Rohde and Schwarz ESU40 and/or Hewlett Packard 8562A Spectrum Analyzer was used as the measuring device for testing the emissions at frequencies above 1 GHz. The analyzer settings used are described in the following table. Refer to the appendix for a complete list of test equipment.

Applicable Standards & Test Procedures

In In accordance with the Federal Communications Commission, Code of Federal Regulations CFR47, dated October 1, 2012, Part 2, Subpart J, Paragraphs 2.907, 2.911, 2.913, 2.925, 2.926, 2.1031 through 2.1057, applicable parts of paragraph Parts 2, 80(E), and Industry Canada RSS-238, the following information is submitted. Test procedures used are the established Methods of Measurement of Radio-Noise Emissions as described in ANSI C63.4-2009 and/or TIA/EIA 603-C.

Test Procedures

Radiated Emission Test Procedure

The EUT was placed on a rotating 1 x 1.5-meter table. EMI energy was maximized by equipment placement, raising and lowering the FSM antenna, changing the antenna polarization, and by rotating the turntable. Each emission was maximized before data was taken using a spectrum analyzer. The frequency spectrum from 9 kHz to 100,000 MHz was searched for during preliminary investigation. Refer to diagram two showing typical test arrangement and photographs in the test setup exhibits for specific EUT placement during testing.

Radio Frequency Power Output

Measurements Required

Measurements shall be made to establish the radio frequency power delivered by the transmitter into the standard output termination. The power output shall be monitored and recorded and no adjustment shall be made to the transmitter after the test has begun except as noted below:

If the power output is adjustable, measurements shall be made for the highest and lowest power levels. Note designs output power is not adjustable.

Test Arrangement Radio Frequency Power Output

The design's peak output power is a function controlled strictly by the magnetron. The peak output power of the design is 4kW. The radio frequency power output was measured at the open area test site with the transmitter operating in a normal mode through all available transmission states. The EUT was separated from the receiving system by a distance of three meters during measurements. The spectrum analyzer had an impedance of 50Ω to match the impedance of the receiving antenna. A Rohde and Schwarz ESU40 and/or HP 8562A Spectrum Analyzer and appropriate mixers were used to measure the radio frequency power at a three-meter distance. During testing data was taken in dBµV/m.

Figure 1 Maximum Power Output

Transmitter Range Setting	Peak Measured emission dBµV/m @ 3 m	Average Measured emission dBµV/m @ 3 m
48 NM	157.7	94.9
1/8 NM	152.3	89.9

Table 1 Radio Frequency Power Output Results (18" antenna)

Rogers Labs, Inc. 4405 West 259th Terrace Louisburg, KS 66053 Phone/Fax: (913) 837-3214 Revision 1 Garmin International, Inc. Modulation Characteristics

Measurements Required

A curve or equivalent data, which shows that the equipment will meet the modulation requirements of the rules, under which the equipment is to be licensed, shall be submitted.

Modulation Characteristics Test Arrangement

The EUT transmits no message and uses no modulation. Therefore, no curves are supplied.

Modulation Characteristics Results

The EUT transmits no message and uses no modulation. Therefore, no curves are supplied. The equipment demonstrated compliance with specifications of Paragraph 2.1046(a) and applicable Parts of 80.215 and RSS-238.

Occupied Bandwidth

Measurements Required

The occupied bandwidth, that is the frequency bandwidth such that below its lower and above its upper frequency limits, the mean powers radiated are each equal to (23 dB and 40-db down) of the total peak power radiated by a given emission.

Table 4 Occupied Bandwidth Results

f _c (MHz)	Observed 40 dB Bandwidth (MHz)	Observed 23dB Bandwidth (MHz)
9425	39.55	15.3

A spectrum analyzer was used to observe the radio frequency spectrum with the transmitter operating in a normal mode. The power ratio in dB representing the 23-dB and 40-dB bandwidth was recorded from the spectrum analyzer. Data for the occupied bandwidth was observed at the RLI OATS using appropriate antennas. Refer to figures three and four showing the analyzer display screen with the analyzer connected to the receiving antenna. The equipment demonstrated compliance with specifications of Paragraph 2.1046(a) and applicable Parts of 80.215 and RSS-238.

Rogers Labs, Inc. 4405 West 259th Terrace Louisburg, KS 66053 Phone/Fax: (913) 837-3214 Revision 1 Garmin International, Inc. Spurious Emissions at Antenna Terminals

Measurements Required

The radio frequency voltage or power generated within the equipment and appearing on a spurious frequency shall be checked at the equipment output terminals when properly loaded with a suitable artificial antenna.

Spurious Emission at Antenna Test Arrangement

Analyzer	Transmitter		Spectrum Analyzer
----------	-------------	--	----------------------

Spurious Emission at Antenna Results

The EUT has no provision to connect directly to the output of the transmitter. Therefore, compliance to the specifications is shown in this and other data presented with this report. The equipment demonstrated compliance with specifications of Paragraph 2.1046(a) and applicable Parts of 80.215 and RSS-238.

Field Strength of Spurious Radiation Measurements Required

Measurements shall be made to detect spurious emissions that may be radiated directly from the cabinet, control circuits, power leads, or intermediate circuit elements under normal conditions of installation and operation.

Field Strength of Spurious Radiation Test Arrangement

The transmitter was placed on a platform at a distance of 3 meters from the FSM antenna. With the EUT radiating into a 50-ohm load attached to the antenna port, the receiving antenna was raised and lowered to obtain the maximum reading of spurious radiation from the EUT on the spectrum analyzer. The platform was rotated though 360 degrees to locate the position registering the highest amplitude of

Rogers Labs, Inc. 4405 West 259th Terrace Louisburg, KS 66053 Phone/Fax: (913) 837-3214 Revision 1 Garmin International, Inc. Model: M3AONR00 Test #: 130826 Test to: CFR47 Parts 2, 80, RSS-238 File: TstRpt M3AONR00 130826 FCC ID: IPH-02356 IC: 1792A-02356 SN: FCC Unit Date: November 8, 2013 Page 16 of 26

NVLAP NVLAP Lab Code 200087-0

emission. The frequency spectrum was then searched for spurious emissions generated from the transmitter and support circuitry. The transmitter was also placed on a platform at a distance of 10 meters from the FSM antenna for power and spurious emissions testing. The amplitude of each spurious emission was maximized by raising and lowering the FSM antenna, and rotating the EUT before final data was recorded. Data presented below demonstrates the general and harmonic spur emissions from the EUT and support equipment taken at 3 meters. Plots were made of the spectrum analyzer display showing emission levels recorded at a one-meter distance in a screen room. Refer to figures five through sixteen showing general radiated emission levels taken in the screen room.

Field Strength of Spurious Results

The EUT was connected to the standard antenna(s) and set to transmit in a normal test mode of operation (with antenna rotation disabled during test). The amplitude of each spurious emission was then maximized and recorded. Measurements were made at a distance of ten meters at the RLI OATS. All other measured spurious emissions where 20-dB or more below the specified limit. The equipment demonstrated compliance with specifications of Paragraph 2.1046(a) and applicable Parts of 80.215 and RSS-238. There are no deviations to the specifications.

RSS-238 requires out of band emissions be at least 60 dB below fundamental emission. Using measured fundamental emissions power of 157.7 dB μ V/m at 3-meters, the limit would be 97.7 dB μ V/m. International Maritime standard EN 60945 requires emission levels less than 54 dB μ V/m at 3-meters, and CFR 47 15.109 requires lower emission levels of which the equipment also complies.

Calculations made are as follows: CFS = Calculated Field Strength FSM = Field Strength Measurement CFS = FSM + Antenna Factor - amplifier gain Example: CFS = 50.6 + 8.9 - 30CFS = 29.5

Frequency Stability

Measurements Required

The frequency stability shall be measured with variations of ambient temperature from -30° to $+50^{\circ}$ centigrade. Measurements shall be made at the extremes of the temperature range and at intervals of not more than 10° centigrade through the range. A period sufficient to stabilize all of the components of the oscillator circuit at each temperature level shall be allowed prior to frequency measurement.

Test Arrangement

The measurement procedure outlined below shall be followed.

<u>Step 1:</u> The transmitter shall be installed in an environmental test chamber whose temperature is controllable. Provision shall be made to measure the frequency of the transmitter.

<u>Step 2:</u> With the transmitter inoperative (power switched "OFF"), the temperature of the test chamber shall be adjusted to $+25^{\circ}$ C. After a temperature stabilization period of one hour at $+25^{\circ}$ C, the transmitter shall be switched "ON" with standard test voltage applied.

<u>Step 3:</u> The carrier shall be keyed "ON", and the transmitter shall be operated at full radio frequency power output at the duty cycle, for which it is rated, for duration of at least 5 minutes. The radio frequency carrier frequency shall be monitored and measurements shall be recorded.

<u>Step 4:</u> The test procedures outlined in Steps 2 and 3, shall be repeated after stabilizing the transmitter at the environmental temperatures specified, -30° C to $+50^{\circ}$ C in 10-degree increments.

The frequency was measured and the variation in parts per million calculated. Data was taken per CFR47 Paragraphs 2.1055 and applicable paragraphs of part 80 and RSS-238.

Table 7 Frequency Stability vs. Temperature Results

Frequency Stability Results

The temperature stability of the unit is determined by the Magnetron. There are no deviations or exceptions to the specifications. The equipment demonstrated compliance with specifications of Paragraph 2.1046(a) and applicable Parts of 80.215 and RSS-238. There are no deviations to the specifications.

Annex C Rogers Qualifications

Scot D. Rogers, Engineer

Rogers Labs, Inc.

Mr. Rogers has approximately 17 years experience in the field of electronics. Engineering experience includes six years in the automated controls industry and remaining years working with the design, development and testing of radio communications and electronic equipment.

Positions Held:

Systems Engineer:	A/C Controls Mfg. Co., Inc. 6 Years
Electrical Engineer:	Rogers Consulting Labs, Inc. 5 Years
Electrical Engineer:	Rogers Labs, Inc. Current

Educational Background:

- 1) Bachelor of Science Degree in Electrical Engineering from Kansas State University
- 2) Bachelor of Science Degree in Business Administration Kansas State University
- 3) Several Specialized Training courses and seminars pertaining to Microprocessors and Software programming.

Annex D FCC Test Site Registration Letter FEDERAL COMMUNICATIONS COMMISSION

Laboratory Division 7435 Oakland Mills Road Columbia, MD 21046

June 28, 2013

Registration Number: 90910

Rogers Labs, Inc. 4405 West 259th Terrace, Louisburg, KS 66053

Attention: Scot Rogers,

Re: Measurement facility located at Louisburg 3 & 10 meter site Date of Renewal: June 28, 2013

Dear Sir or Madam:

Your request for renewal of the registration of the subject measurement facility has been received. The information submitted has been placed in your file and the registration has been renewed. The name of your organization will remain on the list of facilities whose measurement data will be accepted in conjunction with applications for Certification under Parts 15 or 18 of the Commission's Rules. Please note that the file must be updated for any changes made to the facility and the registration must be renewed at least every three years.

Measurement facilities that have indicated that they are available to the public to perform measurement services on a fee basis may be found on the FCC website <u>www.fcc.gov</u> under E-Filing, OET Equipment Authorization Electronic Filing, Test Firms.

Phyllis Parrish Industry Analyst

Annex E Industry Canada Test Site Registration Letter

June 19, 2013

OUR FILE: 46405-3041 Submission No: 168037

Rogers Labs Inc. 4405 West 259th Terrace Louisburg KS, USA 66053

Attention: Mr. Scot D. Rogers

Dear Sir:

The Bureau has received your application for the renewal of 3/10m OATS. Be advised that the information received was satisfactory to Industry Canada. The following number(s) is now associated to the site(s) for which registration / renewal was sought (Site# 3041A-1). Please reference the appropriate site number in the body of test reports containing measurements performed on the site. In addition, please keep for your records the following information;

- The company address code associated to the site(s) located at the above address is: 3041A

Furthermore, to obtain or renew a unique site number, the applicant shall demonstrate that the site has been accredited to ANSI C63.4-2003 or later. A scope of accreditation indicating the accreditation by a recognized accreditation body to ANSI C63.4-2003 or later shall be accepted. Please indicate in a letter the previous assigned site number if applicable and the type of site (example: 3 metre OATS or 3 metre chamber). If the test facility is not accredited to ANSI C63.4-2003 or later, the test facility shall submit test data demonstrating full compliance with the ANSI standard. The Bureau will evaluate the filing to determine if recognition shall be granted.

The frequency for re-validation of the test site and the information that is required to be filed or retained by the testing party shall comply with the requirements established by the accrediting organization. However, in all cases, test site re-validation shall occur on an interval not to **exceed three years**. There is no fee or form associated with an OATS filing. OATS submissions are encouraged to be submitted electronically to the Bureau using the following URL;

http://strategis.ic.gc.ca/epic/internet/inceb-bhst.nsf/en/h tt00052e.html.

If you have any questions, you may contact the Bureau by e-mail at <u>certification.bureau@ic.gc.ca</u> Please reference our file and submission number above for all correspondence.

Yours sincerely,

Bill Payn For: Wireless Laboratory Manager **Certification and Engineering Bureau** 3701 Carling Ave., Building 94 P.O. Box 11490, Station "H" Ottawa, Ontario K2H 8S2 Email: Bill.Payn@ic.gc.ca Tel. No. (613) 990-3639 Fax. No. (613) 990-4752
