

Tune Up Procedure for Garmin A03113:

Each unit's TX and RX functionality for WIFI, ANT, and BTE is tested and judged with a pass/fail criteria during production. Units meeting the criteria continue through production and others are returned for diagnostics.

WIFI

The end user will have the ability to change the frequency channel of the transceiver. Each channel tunes the transceiver to a pre-set frequency set by the Wi-Fi module. The end user will not have the ability to tune the transceiver outside of the certified range.

The following steps describe how to change the Wi-Fi transmit frequency by changing the frequency channel:

- 1) Turn the unit on by pressing the power key.
- 2) From the Home screen select Settings.
- 3) Select Communications.
- 4) Select Wi-Fi Network.
- 5) Select Advanced.
- 6) Select Wireless Channel.
- 7) Use the keypad to enter the desired channel and press Done.
- 8) Use the back key to return to the Wireless Network menu or select Home to return to the main page.

ANT/BTE

The end user will only be able to manage connections and will not have the ability to change the frequency channel, power, or data rate.
