4.0 STATEMENT OF COMPLIANCE

This measuremen	t report demonstrates that the:
Applicant:	Model / HVIN:
Garmin International Inc.	A03125
complies with the SAR (Specific Absorption	Rate) RF exposure requirements and limits specified in the following:
Standard(s):	Measurement Procedure(s):
FCC 47 CFR §2.1093	FCC KDB 865664, FCC KDB 447498, FCC KDB 248227
Health Canada's Safety Code 6	Industry Canada RSS-102 Issue 5
	IEEE Standard 1528-2013, IEC 62209-2
Use Group: Occupational / Controlled	X General Population / Uncontrolled
Reason for Issue: New Certification	

A description of the device, operating configuration, detailed summary of the test results, methodology and procedures used during this evaluation, equipment used and the various provisions of the rules are included within this test report.

5.0 SAR MEASUREMENT SYSTEM

SAR Measurement System

Celltech Labs Inc. SAR measurement facility employs a Dosimetric Assessment System (DASY™) manufactured by Schmid & Partner Engineering AG (SPEAG™) of Zurich, Switzerland. The DASY4 measurement system is comprised of the measurement server, a robot controller, a computer, a near-field probe, a probe alignment sensor, an Elliptical Planar Phantom (ELI) phantom and a specific anthropomorphic mannequin (SAM) phantom for Head and/or Body SAR evaluations. The robot is a six-axis industrial robot performing precise movements to position the probe to the location (points) of maximum electromagnetic field (EMF). A cell controller system contains the power supply, robot controller and a teach pendant (Joystick) to control the robot's servo motors. The Staubli robot is connected to the cell controller to allow software manipulation of the robot. A data acquisition electronic (DAE) circuit performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. is connected to the Electro-optical coupler (EOC). The EOC performs the conversion from the optical form the DAE to digital electronic signal and transfers data to the DASY4 measurement server. The DAE4 utilizes a highly sensitive electrometer-grade preamplifier with auto-zeroing, a channel and gain-switching multiplexer, a fast 16-bit AD-converter, a command decoder and a control logic unit. Transmission to the DASY4 measurement server is accomplished through an optical downlink for data and status information and an optical uplink for commands and clock lines. The mechanical probe-mounting device includes two different sensor systems for frontal and sidewise probe contacts. The sensor systems are also used for mechanical surface detection and probe collision detection. The robot utilizes a controller with built in VME-bus computer.

DASY 4 SAR System with SAM Phantom

DASY 4 Measurement Controller

6.0 RF CONDUCTED POWER MEASUREMENT

Table 6.0										
Conducted Power Measurements										
Channel Frequency Power Power Delta CI (MHz) (dBm) (W) (dBm)

4.4	2462.0000	18.66	20.00	0.10	-1.34	V				

7.0 NUMBER OF TEST CHANNELS (N_C)

As per FCC KDB 248277, the required 802.11 test channels are Ch1, Ch6 and Ch 11

NOTE: These transmitters are not capable of simultaneous transmission. The 802.15 is rated at 4dBm and is below the threshold for standalone SAR evaluation.

8.0 ACCESSORIES EVALUATED

NOTES to Table 10.0

(1) Scaling of the Maximum Measured SAR is based on the highest, 100% duty cycle, Face, Body and/or Head SAR measured of ALL test channels, configurations and accessories used during THIS evaluation. The Measured Fluid Deviation parameters apply only to deviation of the tissue equivalent fluids used at the frequencies which produced the highest measured SAR. The Measured Conducted Power applies to the Conducted Power measured at the frequencies producing the highest Face and Body SAR. The Measured Drift is the SAR drift associated with that specific SAR measurement. The Reported SAR is the accumulation of all SAR Adjustments from the applicable Steps 1 through 4. The Plot ID is for indentification of the SAR Measurement Plots in Annex A of this report.

NOTE: Some of the scaling factors in Steps 1 through 4 may not apply and are identified by light gray text.

Step 1

Per IEC-62209-1 and FCC KDB 865664. Scaling required only when Measured Fluid Deviation is greater than 5%. If the Measured Fluid Deviation is greater than 5%, Table 10.1 will be shown and will indicate the SAR scaling factor in percent (%). SAR is MULTIPLIED by this scaling factor only when the scaling factor is positive (+).

Sten 2

Per KDB 447498. Scaling required only when the difference (Delta) between the Measured Conducted Power and the Manufacturer's Rated Conducted Power is (-) Negative. The absolute value of Delta is ADDED to the SAR.

Step 3

Per KDB 447498 4.3.2. The SAR, either measured or calculated, of ANY and ALL simultaneous transmitters must be added together and includes all contributors.

Step 4

Per IEC 62209-1. Scaling required only when Measured Drift is (-) Negative. The absolute value of Measured Drift is added to Reported or Simultaneous Reported SAR.

Step 5

The Reported SAR is the Maximum Final Adjusted Cumulative SAR from the applicable Steps 1 through 4 and are reported on Page 1 of this report.

I attest that the data reported herein is true and accurate within the tolerance of the Measurement Instrument Uncertainty; that all tests and measurements were performed in accordance with accepted practices or procedures; and that all tests and measurements were performed by me or by trained personnel under my direct supervision. The results of this investigation are based solely on the test sample(s) provided by the client which were not adjusted, modified or altered in any manner whatsoever, except as required to carry out specific tests or measurements. This test report has been completed in accordance with ISO/IEC 17025.

12.0 DETAILS OF SAR EVALUATION

	EVALUATION DETAILS
1	The DUT was evaluated for SAR in accordance with the procedures described in IEEE 1528, FCC KDB 447498, 865664, 248227 and RSS-102. As the antenna is at close proximity to user then the outer surface of the DUT is treated as the radiating surface. The test separation distance was determined by the smallest distance between the outer surface of the device and the user. The DUT was tested, as intended for use, in each of three OEM approved accessories; Chest Strap mount (App.C- B1), Wrist Strap mount (App.C- B2), and Vented Helmet mount (App.C- H1), with the DUT oriented at its closest proximity to the phantom.
2	The DUT was evaluated for SAR at the maximum conducted output power level, preset by the manufacturer. The device was capable of transmitting in Continuous Wave (CW) and was testing in an un-modulated continuous transmit mode at 100% duty cycle.
3	Each SAR Evaluations were performed with a fully charged battery.
4	The fluid temperature remained within +/-2 C from the time of the fluid dielectric parameter measurement to the completion of the SAR evaluation.
5	The fluid temperature remained within +/-0.5□C throughout the test day.

SCAN PROCEDURE	
Maximum distance from the closest measurement point to phantom surface.	4 ± 1mm
Maximum probe angle normal to phantom surface.	5° ± 1°
Area Scan Spatial Resolution ΔX, ΔY	12mm
Zoom Scan Spatial Resolution ΔX, ΔY	5mm
Zoom Scan Spatial Resolution ∆Z	5mm
Zoom Scan Volume X, Y, Z	30mm x 30mm x 30mm
Phantom	ELI
Fluid Depth	150mm

An Area Scan with an area extending beyond the device was used to locate the candidate maximas within 2dB of the global maxima.

A Zoom Scan centered over the peak SAR location(s) determined by the Area Scan was used to determine the 1 gram and 10 gram peak spatial-averge SAR

13.4	13	3.18%	6	6.05	-0.83%	50.83	52.7	-3.55%	2.11	1.95	8.21%				

Prior to the SAR evaluations, system checks were performed on the planar section of the phantom and a SPEAG validation dipole in accordance with the procedures described in IEEE 1528-2013, FCC KDB 865664 and IEC 62209-1.

The dielectric parameters of the simulated tissue mixture were measured prior to the system performance check using a Dielectric Probe Kit and a Network Analyzer.

The forward power was applied to the dipole and the system was verified to a tolerance of +10% from the system manufacturer's dipole calibration target SAR value

Measurement System Specification (Continued)

	Probe Specification
	Symmetrical design with triangular core;
Construction:	Built-in shielding against static charges
	PEEK enclosure material (resistant to organic solvents, glycol)
	In air from 10 MHz to 2.5 GHz
Calibration:	In head simulating tissue at frequencies of 900 MHz
	and 1.8 GHz (accuracy ± 8%)
Frequency:	10 MHz to > 6 GHz; Linearity: ± 0.2 dB (30 MHz to 3 GHz)
Directivity:	± 0.2 dB in head tissue (rotation around probe axis)
Directivity.	\pm 0.4 dB in head tissue (rotation normal to probe axis)
Dynamic Range:	5 μ W/g to > 100 mW/g; Linearity: \pm 0.2 dB
Surface Detect:	±0.2 mm repeatability in air and clear liquids over diffuse reflecting surfaces
Dimensions:	Overall length: 330 mm; Tip length: 16 mm; Body diameter: 12 mm; Tip diameter: 6.8 mm Distance from probe tip to dipole centers: 2.7 mm
Application:	General dosimetry up to 3 GHz; Compliance tests of mobile phone
	D1 4 0 10 4

EX3DV4 E-Field Probe

Phantom Specification

The ELI V5.0 phantom is an elliptical planar fiberglass shell phantom with a shell thickness of 2.0mm +/- .2mm at the planar area. This phantom conforms to OET Bulletin 65, Supplement C, IEEE 1528-2013, IEC 62209-1 and IEC 62209-2.

ELI Phantom

Device Positioner Specification

The DASY4 device positioner has two scales for device rotation (with respect to the body axis) and the device inclination (with respect to the line between the ear openings). The plane between the ear openings and the mouth tip has a rotation angle of 65°. The bottom plate contains three pair of bolts for locking the device holder. The device holder positions are adjusted to the standard measurement positions in the three sections.

Device Positioner
