EMC Test Report - New Certification					
Garmin International Inc. 1200 East 151 St Olathe, KS, 66062					
USA FCC ID:	IC Registration Number				
IPH-03947	1792A-03947				
Product Model Number / HVIN	Product Marketing Name / PMN				
A03947	A03947				

In Accordance With:

CFR Title 47, Part 15 Subpart C (§15.225), (§15.249)

Part 15 Low Power Communication Device Transmitter (DXX)

RSS-Gen, RSS-210 Issue 10

Low Power Transmitter (2400-2483.5MHz)

Approved By:

Ben Hewson, President Celltech Labs Inc. 21-364 Lougheed Rd. Kelowna, BC, V1X 7R8 Canada

Test Lab Certificate: 2470.01

IC Registration 3874A-1

FCC Registration: CA3874

3.0 SCOPE

Preface:

This Certification Report was prepared on behalf of:

Garmin International Inc.

,(the 'Applicant"), in accordance with the applicable Federal Communications Commission (FCC) CFR 47 and Innovation, Scientific and Economic Development (ISED) Canada rules parts and regulations (the '*Rules*'). The scope of this investigation was limited to only the equipment, devices and accessories (the '*Equipment*') supplied by the *Applicant*. The tests and measurements performed on this *Equipment* were only those set forth in the applicable *Rules* and/or the Test and Measurement Standards they reference. The *Rules* applied and the Test and Measurement Standards used during this evaluation appear in the Normative References section of this report. The limits set forth in the technical requirements of the applicable *Rules* were applied to the measurement results obtained during this evaluation and ,unless otherwise noted, these limits were used as the Pass/Fail criteria. The Pass/Fail statements made in this report apply to only the tests and measurements performed on only the *Equipment* tested during this evaluation. Where applicable and permissible, information including test and measurement data and/or results from previous evaluations of same or similar equipment, devices and/or accessories may be cited in this report.

Device:

The Garmin Model/HVIN: A03947 is an extremity worn digital transceiver device consisting of a WiFi, BlueTooth (BT), BlueTooth Low Energy (BLE), Adaptive Network Topology (ANT) and Near Field Communication (NFC) transceivers. The WiFi and BT/BLE/ANT transceivers share the same antenna and cannot simultaneously transmit.

Requirement:

The transceivers of this *equipment* are subject to emissions evaluation in accordance with FCC: 47 CFR 2, 15C, ISED: RSS-Gen, RSS-210 and RSS-247. As per FCC 47 CFR §2.1093 and Health Canada Safety Code 6, an RF Exposure (SAR) evaluation is required for this *Equipment* and the results of the RF Exposure (SAR) evaluation appear in a separate report.

Application:

This is an application for a New Certification.

Scope:

The scope of this investigation is limited to the evaluation and reporting of the wanted and spurious emissions in accordance with the rule parts cited in Normative References section of this report.

I attest that the data reported herein is true and accurate within the tolerance of the Measurement Instrument Uncertainty; that all tests and measurements were performed in accordance with accepted practices or procedures; and that all tests and measurements were performed by me or by trained personnel under my direct supervision. The results of this investigation are based solely on the test sample(s) provided by the client which were not adjusted, modified or altered in any manner w hatsoever, except as required to carry out specific tests or measurements. This test report has been completed in accordance with ISO/IEC 17025.

6.0 FACILITIES AND ACCREDITATIONS

Facility and Accreditation:

The facilities used to evaluate this device outlined in this report are located at 21-364 Lougheed Road, Kelowna, British Columbia, Canada V1X7R8. The radiated emissions site (OATS) conforms to the requirements set forth in ANSI C63.4 and is filed and listed with the FCC under Test Firm Registration Number CA3874A-1 and Industry Canada under Test Site File Number IC 3874A-1. Celltech is accredited to ISO 17025, through accrediting body A2LA and with certificate 2470.01.

7.0 OCCUPIED BANDWIDTH

Normative	FCC 47 CFR §2.1046, RSS-Gen (6.1.2), RSS-247 (5.4)(d),
Reference	KDB 558074 (8.3.2.1), ANSI C63.10 (6.9.3)
General Procedu	ire and a second se
C63.10 (6.9.3)	6.9.3 Occupied bandwidth—power bandwidth (99%) measurement procedure
	The occupied bandwidth is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers are each equal to 0.5% of the total mean power of the given emission. The following procedure shall be used for measuring 99% power bandwidth:
	a) The instrument center frequency is set to the nominal EUT channel center frequency. The frequency span for the spectrum analyzer shall be between 1.5 times and 5.0 times the OBM
	b) The nominal IF filter bandwidth (3 dB RBW) shall be in the range of 1% to 5% of the OBW and VBW shall be approximately three times the RBW, unless otherwise specified by the applicable requirement.
	c) Set the reference level of the instrument as required, keeping the signal from exceeding the maximum input mixer level for linear operation. In general, the peak of the spectral envelope shall be more than [10 log (OBW/RBW)] below the reference level. Specific guidance is given in 4.1.5.2.
	d) Step a) through step c) might require iteration to adjust within the specified range.
	e) Video averaging is not permitted. Where practical, a sample detection and single sweep mode shall be used. Otherwise, peak detection and max hold mode (until the trace stabilizes shall be used.
	f) Use the 99% power bandwidth function of the instrument (if available) and report the measured bandwidth.
Test Setup	Appendix A - Figure A.1
Measurement Pro	ocedure

The DUT was connected to a Spectrum Analyzer (SA) va a 30dB attenuator connected to the DUT's antenna port. The SA was configured as described above using the 99% Occupied Bandwidth function. The output power of the DUT was set to the manufacturer's highest output power setting at the Low, Mid and High frequency channels as permitted by the device. The DUT was set to transmit at its maximum Duty Cycle. The 99% Occupied Bandwidth was measured and recorded.

8.0 FIELD STRENGTH

Iormative Referenc	e FCC 47 CFR §2.1046, §15.249, RSS-210
	KDB 558074 (8.3.2), ANSI C63.10 (11.9.2.2.6)
.imits	
§15.249(a)	Operation within the bands 902-928 MHz, 2400-2483.5 MHz, 5725-5875 MHZ, and 24.0 24.25 GHz.
	(a) Except as provided in paragraph (b) of this section, the field strength of emissions from intentional radiators operated within these frequency bands shall comply with the following:
	2400-2483.5MHz, Fundamental Field Strength: 50mV/m, Harmonic: 500uV/m
RSS-210 B.10(a)	Bands 902-928 MHz, 2400-2483.5 MHz, 5725-5875 MHz and 24-24.25 GHz
	(a) The field strength of fundamental and harmonic emissions measured at 3 m shall not exceed the limits in table B2.
	2400-2483.5MHz, Fundamental Field Strength: 50mV/m, Harmonic: 500uV/m
eneral Procedure	
C63.10 (6.5.4)	6.5.4 Final radiated emission tests
	Using the orientation and equipment arrangement of the EUT, and based on the measurement results found during the exploratory measurement in 6.5.3, the EUT arrangement, appropriate modulation, and modes of operation that produce the emissions that have the highest amplitude relative to the limit shall be selected for the final measurement. The final measurement shall follow all the procedures in 6.3 with the EUT operating on frequencies per 5.6. For each mode selected, record the frequency and amplitude of the highest fundamental emission (if applicable) and the frequency and amplitude of the six highest spurious emissions relative to the limit; emissions more than 2 dB below the limit do not need to be reported.
	Measurements are performed with the EUT rotated from 0° to 360°, the antenna height scanned between 1 m and 4 m, and the antenna rotated to repeat the measurements for be the horizontal and vertical antenna polarizations. Variations in cable or wire placement sha be explored to maximize the measured emissions.
	Appendix A Figure A.2

The DUT place on a 80cm high turntable on an Open Area Test Site (OATS) at a distance of 3m from the measurement antenna. The DUT was set to transmit at maximum power and duty cycle. The DUT was rotated 360 degrees and scanned with the receive antenna elevated from 1 to 4m. The emissions were measured and recorded.

9.0 20DB BW

Test Procedure	
Normative Reference	FCC 47 CFR §2.1051, §15.215
Normative Reference	ANSI C63.10 (6.10.3)
Limits	
§15.215(c)	Additional provisions to the general radiated emission limitations.
	(c) Intentional radiators operating under the alternative provisions to the general emission limits, as contained in §§15.217 through 15.257 and in subpart E of this part, must be designed to ensure that the 20 dB bandwidth of the emission, or whatever bandwidth may otherwise be specified in the specific rule section under which the equipment operates, is
	contained within the frequency band designated in the rule section under which the equipment is operated.
General Procedure	
C63.10 (6.3.10)	6.10.3 Unlicensed wireless device operational configuration
	Set the EUT to operate at 100% duty cycle or equivalent "normal mode of operation." ⁵⁴ Testing shall be performed at the lowest frequency channel and highest frequency channel within the allowed operating band. ⁵⁵ Testing shall be performed for each frequency with every applicable unlicensed wireless device configuration. If more than one power output level is available, then testing shall be done with the appropriate maximum power output for each antenna combination or modulation, as recorded in the unlicensed wireless device conducted power measurement results. The highest gain of each antenna type shall be used for this test.
	s devices unable to be configured for 100% duty cycle even in test mode, configure the uration duty cycle supported.
outside the band permitt	g, for example, in the 2.4 GHz band, have hardware capability to operate at frequencies ed by the regulatory authority. Testing shall only be done at the lowest and highest lowed frequency band (see Annex A for examples of regulatory requirements and frequency
Test Setup	Appendix A Figure A.1
Measurement Proced	ure
	to a Spectrum Analyzer (SA) via a 30dB attenuator connected to the DUT's antenna port

The DUT was connected to a Spectrum Analyzer (SA) via a 30dB attenuator connected to the DUT's antenna port. The SA was configured as described above. The output power of the DUT was set to the manufacturer's highest output power setting at the Low and High frequency channels as permitted by the device. The unwanted band edge emissions were measured and recorded.

13.0 RADIATED RX SPURIOUS EMISSIONS

Test Procedure							
Normative Reference	FCC 47 CFR §2.1046						
	KDB 558074 (8.3.2), ANSI C63.10 (11.9.2.2.6)						
General Procedure							
C63.10 (6.5.4)	5.5.4 Final radiated emission tests						
	Using the orientation and equipment arrangement of the EUT, and based on the measurement results found during the exploratory measurement in 6.5.3, the EUT arrangement, appropriate modulation, and modes of operation that produce the emissions that have the highest amplitude relative to the limit shall be selected for the final measurement. The final measurement shall follow all the procedures in 6.3 with the EUT operating on frequencies per 5.6. For each mode selected, record the frequency and amplitude of the highest fundamental emission (if applicable) and the frequency and amplitude of the six highest spurious emissions relative to the limit; emissions more than 20 dB below the limit do not need to be reported.						
	Measurements are performed with the EUT rotated from 0° to 360°, the antenna height scanned between 1 m and 4 m, and the antenna rotated to repeat the measurements for bot the horizontal and vertical antenna polarizations. Variations in cable or wire placement shall be explored to maximize the measured emissions.						
Test Setup	Appendix A Figure A.2						
Measurement Proced	ure						
measurement antenna. ٦	m high turntable on an Open Area Test Site (OATS) at a distance of 3m from the The DUT was set to transmit at maximum power and duty cycle. The DUT was rotated 360 th the receive antenna elevated from 1 to 4m. The emissions were measured and recorded.

	1 CC 47 CI K §2. 1033, §13.223, K33-Gell, K33-210							
Limits								
47 CFR §15.225	(e) The frequency tolerance of the carrier signal shall be maintained within $\pm 0.01\%$ of the operating frequency over a temperature variation of -20 degrees to $+50$ degrees C at normal supply voltage, and for a variation in the primary supply voltage from 85% to 115% of the rated supply voltage at a temperature of 20 degrees C. For battery operated equipment, the equipment tests shall be performed using a new battery.							
RSS-210 B.6	(b) the carrier frequency stability shall not exceed ±100 ppm							
Measurement Procedure								
47 CFR §2.1055	Frequency Stability							
(a) The frequency stabili	ty shall be measured with variation of ambient temperature as follows:							
(1) From -30° to +50° ce	entigrade for all equipment except that specified in paragraphs (a) (2) and (3) of this section.							
more than 10° centigrad	(b) Frequency measurements shall be made at the extremes of the specified temperature range and at intervals of not more than 10° centigrade through the range. A period of time sufficient to stabilize all of the components of the oscillator circuit at each temperature level shall be allowed prior to frequency measurement.							
(d) The frequency stabili	ty shall be measured with variation of primary supply voltage as follows:							
(1) Vary primary supply voltage from 85 to 115 percent of the nominal value for other than hand carried battery equipment.								
Test Setup	Appendix A							

Table 14.1 – Summary of Frequency Stability Measurements

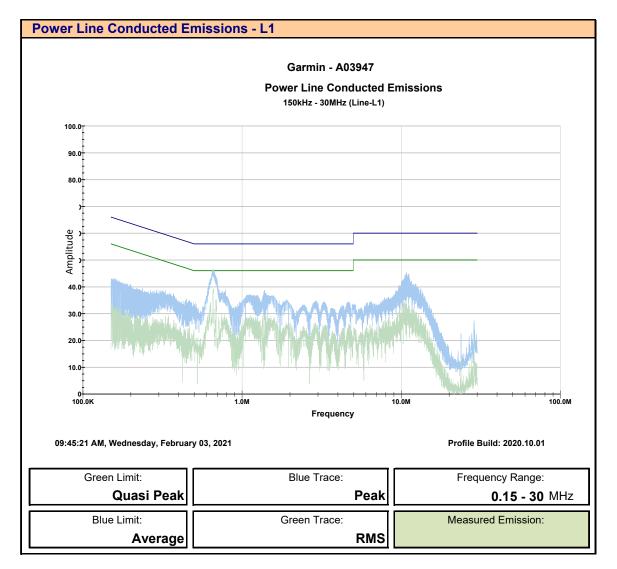

15.0 POWER LINE CONDUCTED EMISSIONS

	FCC 47 CFR §15.107, ICES-003(6.1)
Normative Reference	ANSI C63.4-2014
Limits	
47 CFR §15.107	(a) Except for Class A digital devices, for equipment that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line or any frequency or frequencies within the band 150 kHz to 30 MHz shall not exceed the limits in the following table, as measured using a 50 μ H/50 ohms line impedance stabilization network (LISN). Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the band edges. 0.15-0.5MHz: 66-56 dBuV Quasi Peak, 56-46 dBuV Average, Decreases with the logrithm of the frequency
	0.5 - 5.0 MHz: 56 dBuV Quasi Peak, 46 dBuV Average 5.0 - 30.0 MHz: 60 dBuV Quasi Peak, 50 dBuV Average
ICES-003(6.1)	6.1 - AC Power Line Conducted Emissions Limits
	Class B: ITE that does not meet the conditions for Class A operation shall comply with the Class B radiated limits set out in Table 2.
	0.15-0.5MHz: 66-56 dBuV Quasi Peak, 56-46 dBuV Average, Decreases with the logrithm of the
	0.5 - 5.0 MHz: 56 dBuV Quasi Peak, 46 dBuV Average
	5.0 - 30.0 MHz: 60 dBuV Quasi Peak, 50 dBuV Average
Test Setup	Appendix A Figure A.7

			-			-		-		Res	ults:	Comp	lies

* In accordance with FCC §15.35 and ANSI C63.4, a Peak detector may be used to demonstrate compliance to Quasi-Peak limits provided the Resolution Bandwidth (RBW) is equal to or greater than Quasi-Peak bandwidth. The Detector RBW employed was ≥ 9kHz.

(2) LISN Insertion Loss, Cable Loss and Amplifier Gain corrected in Spectrum Analyzer Transducer Factor

(3) External Amplier not used

 $\mathsf{E}_{\mathsf{Corr}} = \mathsf{E}_{\mathsf{Meas}} + \mathsf{L}_{\mathsf{LISN}} + \mathsf{L}_{\mathsf{C}} - \mathsf{G}_{\mathsf{A}}$

Class B QP Limit = 56 - 20Log (f_{Emm} /500) for f_{Emm} = 150kHz to 500kHz

Class B Avg Limit = 46 - 20Log ($f_{Emm}/500$) for f_{Emm} = 150kHz to 500kHz

Class A QP Limit = 79dBuV for f_{Emm} = 150kHz to 500kHz

Class A Avg Limit = 66dBuV for f_{Emm} = 150kHz to 500kHz

Margin = Limit - E_{corr}

COU: Calibrate On Use

APPENDIX C – MEASUREMENT INSTRUMENT UNCERTAINTY

CISPR 16-4 Measurement Uncertainty (ULAB)	
This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence interval using a coverage factor of	of k=2
30MHz - 200MHz	
$U_{LAB} = 5.14 dB$ $U_{CISPR} = 6.3 dB$	
200MHz - 1000MHz	
$U_{LAB} = 5.90 dB$ $U_{CISPR} = 6.3 dB$	
1GHz - 6GHz	
$U_{LAB} = 4.80 dB$ $U_{CISPR} = 5.2 dB$	
6GHz - 18GHz	
$U_{LAB} = 5.1 dB$ $U_{CISPR} = 5.5 dB$	
If the calculated uncertainty U _{lab} is less than U_{CISPR} then:	
1 Compliance is deemed to occur if NO measured disturbance exceeds the disturbance limit	
2 Non-Compliance is deemed to occur if ANY measured disturbance EXCEEDS the disturbance limit	
If the calculated uncertainty U _{lab} is greater than U _{CISPR} then:	
Compliance is deemed to occur if NO measured disturbance, increased by (U _{lab} - U _{CISPR}), exceeds the disturbance limit	
Non-Compliance is deemed to occur if ANY measured disturbance, increased by (U _{lab} - U _{CISPR}), EXCEEDS the disturbance limit
