Distance (d)	20	cm
--------------	----	----

Note: The user’s manual will stipulate that a 20cm minimum distance from the user is to be maintained. EIRP values in mW were multiplied by 1.1 to account for a 10% tolerance.

The power density is calculated as shown below:

$$S = (Peak\ EIRP + 10\% Tol.) / (4 \times \pi \times d^2) - \text{used to calculate exposure at "d" cm}$$

$$EIRP = P \times G, \text{ measured as field strength}$$

S= power density

P = transmitter conducted power (in mW)

G = antenna numeric gain

d = distance to radiation center (20 cm)

IC / ISED

Using RSS-102, Issue 5, Section 2.5.2

RF exposure evaluation is required if the separation distance between the user and/or bystander and the device's radiating element is greater than 20 cm, except when the device operates as follows:

- below 20 MHz and the source-based, time-averaged maximum e.i.r.p. of the device is equal to or less than 1 W (adjusted for tune-up tolerance);
- at or above 20 MHz and below 48 MHz and the source-based, time-averaged maximum e.i.r.p. of the device is equal to or less than $4.49/f^{0.5}$ W (adjusted for tune-up tolerance), where f is in MHz;
- at or above 48 MHz and below 300 MHz and the source-based, time-averaged maximum e.i.r.p. of the device is equal to or less than 0.6 W (adjusted for tune-up tolerance);
- at or above 300 MHz and below 6 GHz and the source-based, time-averaged maximum e.i.r.p. of the device is equal to or less than $1.31 \times 10^{-2} f^{(0.6834)}$ W (adjusted for tune-up tolerance), where f is in MHz.
- at or above 6 GHz and the source-based, time-averaged maximum e.i.r.p. of the device is equal to or less than 5 W (adjusted for tune-up tolerance). In these cases, the information contained in the RF exposure.
