### 3.0 SCOPE OF EVALUATION

This Certification Report was prepared on behalf of:

#### Garmin International Inc.

,(the 'Applicant"), in accordance with the applicable Federal Communications Commission (FCC) CFR 47 (the 'Rules'). The scope of this investigation was limited to only the equipment, devices and accessories (the 'Equipment') supplied by the Applicant. The tests and measurements performed on this Equipment were only those set forth in the applicable Rules and/or the Test and Measurement Standards they reference. The Rules applied and the Test and Measurement Standards used during this evaluation appear in the Normative References section of this report. The limits set forth in the technical requirements of the applicable Rules were applied to the measurement results obtained during this evaluation and ,unless otherwise noted, these limits were used as the Pass/Fail criteria. The Pass/Fail statements made in this report apply to only the tests and measurements performed on only the Equipment tested during this evaluation. Where applicable and permissible, information including test and measurement data and/or results from previous evaluations of same or similar equipment, devices and/or accessories may be cited in this report.

As per FCC 47 CFR Part §2.1091 and §2.1093, an RF Exposure evaluation report is required for this *Equipment* and the results of the RF Exposure evaluation appear in this report.

The A04536 FCC ID: IPH-04536, IC ID:1792A-04536 is a Low Power Digital Transmitter that offers use as a hand-held, transportation mounted or portable configuration , with a Wi-Fi transceiver that is capable of operating in the 2.4GHz WiFi, 5GHz U-NII-1 & 3 frequency bands as well as 2.4Ghz ANT /BT/BLE frequency bands. The device has two antennas, for the 2.4GHz and a 5Ghz frequencies and is capable of simultaneous transmisson between the BT and UNII banks. The device is intended for General Population Use. The product operates from an internal proprietary Li-ion rechargeable battery which can be connected to a compliant USB interface port, AC or DC adapter for charging. Test samples provided by the manufacturer were capable of transmitting at select frequencies and modulations preset by the manufacturer. An additional antenna modification was prepared for one sample allowing the ability to connect test equipment for antenna port conducted power analysis. The DUT was evaluated for SAR at the maximum conducted output power level, preset by the manufacturer and in accordance with the procedures described in IEC/IEEE 62209-1528, FCC KDB 865646, 447498, 248227. A description of the device, operating configuration, detailed summary of the test results, methodology and procedures used in the evaluation, equipment used and the various provisions of the rules are included within this test report.

### **5.0 STATEMENT OF COMPLIANCE**

This measurement report demonstrates that samples of the product model(s) were evaluated for Specific Absorption Rate (SAR) on the date(s) shown, in accordance with the Measurement Procedures cited and were found to comply with the Standard(s) Applied based on the Exposure Limits of the Use Group indicated for which the product is intended to be used.

The results of this investigation are based solely on the test sample(s) provided by the applicant which was not adjusted, modified or altered in any manner whatsoever except as required to carry out specific tests or measurements. A description of the device, operating configuration, detailed summary of the test results, methodologies and procedures used during this evaluation, the equipment used and the various provisions of the rules are included in this test report.

I attest that the data reported herein is true and accurate within the tolerance of the Measurement Instrument Uncertainty; that all tests and measurements were performed in accordance with accepted practices or procedures; and that all tests and measurements were performed by me or by trained personnel under my direct supervision. The results of this investigation are based solely on the test sample(s) provided by the client which were not adjusted, modified or altered in any manner whatsoever, except as required to carry out specific tests or measurements. This test report has been completed in accordance with ISO/IEC 17025.

# **6.0 SAR MEASUREMENT SYSTEM**

# **SAR Measurement System**

Celltech Labs Inc. SAR measurement facility employs a Dosimetric Assessment System (DASY™) manufactured by Schmid & Partner Engineering AG (SPEAG™) of Zurich, Switzerland. The DASY6 measurement system is comprised of the measurement server, a robot controller, a computer, a near-field probe, a probe alignment sensor, an Elliptical Planar Phantom (ELI) phantom and a specific anthropomorphic mannequin (SAM) phantom for Head and/or Body SAR evaluations. The robot is a six-axis industrial robot performing precise movements to position the probe to the location (points) of maximum electromagnetic field (EMF). A cell controller system contains the power supply, robot controller and a teach pendant (Joystick) to control the robot's servo motors. The Staubli robot is connected to the cell controller to allow software manipulation of the robot. A data acquisition electronic (DAE) circuit performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. is connected to the Electro-optical coupler (EOC). The EOC performs the conversion from the optical form the DAE to digital electronic signal and transfers data to the DASY6 measurement server. The DAE4 utilizes a highly sensitive electrometer-grade preamplifier with auto-zeroing, a channel and gainswitching multiplexer, a fast 16-bit AD-converter, a command decoder and a control logic unit. Transmission to the DASY6 measurement server is accomplished through an optical downlink for data and status information and an optical uplink for commands and clock lines. The mechanical probe-mounting device includes two different sensor systems for frontal and sidewise probe contacts. The sensor systems are also used for mechanical surface detection and probe collision detection. The robot utilizes a controller with built in VME-bus computer.

The rated power and tolerance are stated for typical transmission modes and data rates. Some modes and data rates may produce lower than rated conducted power levels. Power measurements taken across the various channels, modes and data rates did not produce levels in excess of the Rated Power plus Tolerance. SAR was evaluated using the power level setting specified by the manufacture to be the max output power and produce the most conservative SAR. SAR was evaluated at the <u>maximum average</u> tune up tolerance. See section 2.0 Client and Device Information for details. The <u>reported</u> SAR was not scaled down.

45461793 R1.0 3 February 2023

## 8.0 NUMBER OF TEST CHANNELS (Nc)

#### Table 8.1 Number of Test Channels

#### Wi-FI SAR Evaluation:

SAR was evaluated in DSSS mode at the maximum duty cycle. The power level setting selected was specified by the manufacturer to be the max output power and produce the most conservative SAR.

As per FCC KDB 248227, the required 802.11 test channels are Ch1, Ch 6 and Ch 11. The mid-channel conducted power at various bit rates was evaluated to derive the worse case and the conducted output power was investigated on channels with this bit rate. The highest conduced power was found on Channel 7. As a result, this channel was selected for initial SAR evaluation.

SAR test reduction methodology was applied to reduce the total number of required test channels from the SAR test evaluation.

When applicable, SAR test reduction methods may be utilized.

802.11b DSSS SAR test reduction is determined according to the following:

- a) When the <u>reported</u> SAR of the highest measured maximum output power channel is ≤ to 0.8 W/kg, no further SAR testing is required for 802.11b DSSS in that exposure configuration.
- b) When the <u>reported</u> SAR is > 0.8 W/kg, SAR is required for that exposure configuration using the next highest output power channel. When any <u>reported</u> SAR is > 1.2 W/Kg, SAR is required for the third channel.

#### 2.4 GHz 802.11g/n OFDM SAR Test Exclusion Requirements

- a) When KDB Publication 447498 SAR test exclusion applies to the OFDM configuration.
- b) When the highest reported SAR for DSSS is adjusted by the ratio of OFDM to DSSS specified maximum output power and the adjusted SAR is ≤ 1.2 W/kg.

The initial test configuration for 2.4 GHz and 5 GHz OFDM transmission modes is determined by the 802.11 configuration with the highest maximum output power specified for production units, including tune-up tolerance, in each standalone and aggregated frequency band. An initial test position was established for the 2.4 GHz and the UNII1 / UNII 3 bands.

When the reported SAR of the initial test configuration is > 0.8 W/kg, SAR measurement is required for subsequent next highest measured output power channel(s) in the initial test configuration until reported SAR is  $\leq$  1.2 W/kg or all required channels are tested.

NOTE: The Bluetooth transmitter is capable of simultaneous transmission with the 5GHz WiFi Transmitter. The device SAR was evaluated for simultaneous SAR.

45461793 R1.0 3 February 2023

As per KDB 447498 D01V06, where appropriate SAR test exclusion based on antenna test separation distances may be applied.

- 1. When the distance is < 50mm exclusion threshold is "Ratio". when the distance is >50 mm exclusion is in "mW"
- Maximum power is the source-based-time-average power and represents the maximum RF output power among production units.
- 3. Per KDB 447498 D01v06, for larger devices, the test separation distance of adjacent edge configuration is determined by the closest separation between the antenna and the user
- 4. Per KDB 447498 D01v06, standalone SAR test exclusion threshold is applied; If the test separation distance is < 5mm, 5mm is used to determine SAR exclusion threshold
- 5. Per KDB 447498 D01v06, the 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances ≤ 50mm are determined by; (step a)

[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)]\*[ $\sqrt{f(GHz)}$ ]  $\leq 3.0$  for 1-g SAR and  $\leq 7.5$  for 10-g extremity SAR

- f(GHz) is the f channel transmit frequency in GHz
- power and distance are rounded to the nearest MW and mm before calculation
- result is rounded to one decimal place for comparison
- the values 3.0 and 7.5 are referred to as numeric thresholds in step b
- 6. Per KDB 447498 D01v06, at 100 MHz to 6 GHz and for test separation distance > 50mm, the SAR test exclusion threshold is determined according to t the following; (step b)
  - a) [Power allowed at numeric threshold for 50 mm in step a) + test separation distance 50mm)\*(f(MHz)/150)] mW, at 100 MHz to 1500 MHz
  - b) [Power allowed at numeric threshold for 50 mm in step a) + (test separation distance -50mm)\* 10] mW at > 1500MHz and ≤ 6GHz

#### **NOTES** to Table

Scaling of the Maximum Measured SAR is based on the highest Face, Body and/or Head SAR measured of ALL test channels, configurations and accessories used during THIS evaluation. The Measured Fluid Deviation parameters apply only to deviation of the tissue equivalent fluids used at the frequencies which produced the highest measured SAR. The Measured Conducted Power applies to the Conducted Power measured at the frequencies producing the highest Face, Body and/or Head SAR. The Measured Drift is the SAR drift associated with that specific SAR measurement. The Reported SAR is the accumulation of all SAR Adjustments from the applicable Steps 1 through 4. The Plot ID is for indentification of the SAR Measurement Plots in the Annexes of this report.

NOTE: Some of the scaling factors in Steps 1 through 4may not apply and are identified by grayed fields.

#### Step 1

Per IEC/IEEE 62209-1528, FCC KDB 865664, ISED RSS-102 and ISED Notice 2012-DRS0529. Scaling required only when Measured Fluid Deviation is greater than 5%. If the Measured Fluid Deviation is greater than 5%,

Table 10.1 will be shown and will indicate the SAR scaling factor in percent (%). SAR is MULTIPLIED by this scaling factor only when the scaling factor is positive (+).

#### Step 2

Per IEC/IEEE 62209-1528, FCC KDB 865664 and ISED RSS-102. Scaling required only when the difference (Delta) between the Measured Conducted Power and the Manufacturer's Rated Conducted Power is (-) Negative.

The absolute value of Delta is ADDED to the SAR.

#### Step 3

Per IEC/IEEE 62209-1528, FCC KDB 865664 and ISED RSS-102. Scaling required only when Measured Drift is (-) Negative. The absolute value of Measured Drift is added to Reported.

#### Step 4

Per IEC/IEEE 62209-1528, FCC KDB 865664 and ISED RSS-102. When the transmit Duty Cyle (DC) is less than 100%, the <u>reported</u> SAR must be scaled to 100% by the Crest Factor (CF). CF = 1/DC where DC is in decimal.

#### Step 5

The Reported SAR is the Maximum Final Adjusted SAR from the applicable Steps 1 through 4and are reported on Page 1 of this report.

#### 11.3 Simultaneous SAR - FCC

The estimated Bluetooth SAR, in accordance with FCC KDB 447498 D01v06 4.3.2 (b)(1), is given by:

$$SAR = \frac{P}{d} X \frac{\sqrt{f}}{x}$$

Where P is power, mW, d is separation distance, mm, f is frequency, GHz and x = 7.5 for 1g SAR and 18.75 for 10g SAR

1g SAR; 2.81mW, d = 5mm, f = 2.440GHz = 0.117W/kg 10g SAR; 2.81mW, d = 5mm, f = 2.440GHz = 0.047W/kg

Simultaneous SAR = SAR<sub>1</sub> + SAR<sub>2</sub>

Where SAR<sub>1</sub> = highest measured <u>reported</u> SAR, SAR<sub>2</sub> = Standalone Bluetooth SAR 5Ghz Body Config (1g) SAR<sub>1</sub> = 0.489W/kg, SAR<sub>2</sub> = 0.117W/kg 5Ghz Extremity Config (10g) SAR<sub>1</sub> = 0.197W/kg, SAR<sub>2</sub> = 0.047W/kg

1g Simultaneous reported SAR = 0.606W/kg

10g Simultaneous <u>reported</u> SAR = 0.244W/kg

### 13.2 DUT Setup and Configuration

#### **DUT Setup and Configuration**

### Overview

The DUT was evaluated for Body SAR at the maximum conducted output power level, preset by the manufacturer, with a fully charged battery in unmodulated continuous transmit operation (Maximum duty cycle), as provided by the manufacturer with a unit set up and pre-installed with Compliance Test Mode.

### 13.3 DUT Positioning

### **DUT Positioning**

#### **Positioning**

The DUT Positioner was securely fastened to the Phantom Platform to ensure consistent positioning of the DUT for each test evaluation.

#### **FACE Configuration**

This device is not capable of voice communication and was not tested in the FACE configuration.

#### **BODY Configuration**

There are no Body-Worn and Audio Accessories for this device however the device could be rested on the torso while transmitting. BODY configuration was evaluted at a separation distance of 5mm.

#### **HEAD Configuration**

This device is not intended to be held to the ear and was not tested in the HEAD configuration.

#### **EXTREMITY**

#### Configuration

The DUT, was securely clamped into the device holder with the surface of the DUT normally in contact with the body (hand) in direct contact with the bottom of the phantom, or 0mm separation from the DUT to the phantom resembling that for which it was intended to be used.

45461793 R1.0 3 February 2023

#### 13.4 General Procedures and Report

#### **General Procedures and Reporting**

#### **General Procedures**

The fluid dielectric parameters of the Active Tissue Simulating Liquid (TSL) were measured as described in this Section, recorded and entered into the DASY Measurement Server. Active meaning the TSL used during the SAR evaluation of the DUT. The temperature of the Active TSL was measured and recorded prior to performing a System Performance Check (SPC). An SPC was performed with the Active TSL prior to the start of the test series. The temperature of the Active TSL was measured throughout the day and the Active TSL temperature was maintained to  $\pm 0.5^{\circ}$ C. The Active TSL temperature was maintained to within  $\pm 2.0^{\circ}$ C throughout the test series. The liquid parameters shall be measured within 24 hours before the start of a test series and if it takes longer than 48 hours, the liquid parameters shall also be measured at the end of the test series.

An Area Scan exceeding the length and width of the DUT projection was performed and the locations of all maximas within 2dB of the Peak SAR recorded. A Zoom Scan centered over the Peak SAR location(s) was performed and the 1g and 10g SAR values recorded. The resolutions of the Area Scan and Zoom Scan are described in the Scan Resolution table(s) in this Section. A Power Reference Measurement was taken at the phantom reference point immediately prior to the Area Scan. A Power Drift measurement was taken at the phantom reference point immediately following the Zoom Scan to determine the power drift. A Z-Scan from the <u>Maximum Distance to Phantom Surface</u> to the fluid surface was performed following the power drift measurement.

#### Reporting

The 1g SAR, 10g SAR and power drift measurements are recorded in the SAR Measurement Summary tables in the SAR Measurement Summary Section of this report. The SAR values shown in the SAR column are the SAR values reported by the SAR Measurement Server with the DUT operating at maximum transmit duty cycle. These tables also include other information such as transmit channel and frequency, modulation, accessories tested and DUT-phantom separation distance.

In the Scaling of Maximum Measured SAR Section of this report, the highest measured SAR in the BODY configuration, within the entire scope of this assessment, are, when applicable, scaled for Fluid Sensitivity, Manufacturer's Tune-Up Tolerance, Simultaneous Transmission and Drift. With the exception of Duty Cycle correction/compensation, SAR values are ONLY scaled up, not down. The final results of this scaling is the reported SAR which appears on the Cover Page of this report.

45461793 R1.0 3 February 2023

#### 13.5 Fluid Dielectric and Systems Performance Check

#### Fluid Dielectric and Systems Performance Check

#### Fluid Dielectric Measurement Procedure

The fluid dielectric parameters of the Tissue Simulating Liquid (TSL) are measured using the Open-Ended Coax Method connected to an Agilent 8753ET Network Analyzer connected to a measurement server running Aprel Dielectric Property Measurement System. A frequency range of ± 100MHz for frequencies > 300MHz and ± 50MHz for frequencies ≤ 300MHz with frequency step size of 10MHz is used. The center frequency is centered around the SAR measurement probe's calibration point for that TSL frequency range. A calibration of the setup is performed using a short-open-deionized water (at 23°C in a 300ml beaker) method. A sample of the TSL is placed in a 300ml beaker and the open-ended coax is submerged approximately 8mm below the fluid surface in the approximate center of the beaker. A check of the setup is made to ensure no air is trapped under the open-ended coax. The sample of TSL is measured and compared to the FCC KDB 865664 targets for HEAD or BODY for the entire fluid measurement range. Fluid adjustment are made if the dielectric parameters are > 5% in range that the DUT is to be tested. If the adjustments fail to bring the parameters to ≤ 5% but are < 10%, the SAR Fluid Sensitivity as per IEC 62209-1528 and FCC KDB 865664 are applied to the highest measured SAR. A TSL with dielectric parameters > 10% in the DUT test frequency range are not used.

#### Systems Performance Check

The fluid dielectric parameters of the Active TSL are entered into the DASY Measurement Server at each of the 10MHz step size intervals. Active meaning the TSL used during the SAR evaluation of the DUT. The DASY Measurement System will automatically interpolate the dielectric parameters for DUT test frequencies that fall between the 10MHz step intervals.

A Systems Performance Check (SPC) is performed in accordance with IEC 62209-1528 "System Check" and FCC KDB 865664 "System Verification". A validation source, dipole or Confined Loop Antenna (CLA), is placed under the geometric center of the phantom and separated from the phantom in accordance to the validation source's Calibration Certificate data. A CW signal set to the frequency of the validate source's and SAR measurement probe's calibration frequency with a forward power set to the validation source's Calibration Certificate data power setting is applied to the validation source. An Area Scan is centered over the projection of the validation source's feed point and an Area Scan is taken. A Zoom Scan centered over the Peak SAR measurement of the Area Scan and the 1g and 10g SAR is measured. The measured 1g and 10g SAR is compared to the 1g and 10g SAR measurements from the validation source's Calibration Certificate. When required, the measured SAR is normalized to 1.0W and compared to the normalized SAR indicated on the validation source's Calibration Certificate. The SPC is considered valid when the measured and normalized SAR is ≤ 10% of the measured and normalize SAR of the validation source's Calibration Certificate.

The fluid dielectric parameters of the Active TSL and SPC are repeated when the Active TSL has been in use for greater than 84 hours or if the Active TSL temperature has exceed ± 1°C of the initial fluid analysis.

| Zoom Scan Volume X, Y, Z  | 30 mm        |  |  |  |  |  |  |  |
| Phantom   | ELI          |  |  |  |  |  |  |  |
| Fluid Depth   | 150 ± 5 mm   |  |  |  |  |  |  |  |

An Area Scan with an area extending beyond the device was used to locate the candidate maximas within 2dB of the global maxima.

A Zoom Scan centered over the peak SAR location(s) determined by the Area Scan was used to determine the 1-gram and 10-gram peak spatial-average SAR

#### 13.7 Scan Resolution 2GHz to 3GHz

| Scan Resolution 2GHz to 3GHz  |              |  |  |  |  |  |  |  |
|---|--------------|--|--|--|--|--|--|--|
| Maximum distance from the closest measurement point to phantom surface: | 4 ± 1 mm     |  |  |  |  |  |  |  |

### 14.0 MEASUREMENT UNCERTAINTIES

### **Table 14.1 Measurement Uncertainty**

Per FCC KDB 865664 D01v01r04, 2.8.2, SAR Measurement Uncertainty is only required when the reported SAR is:

- ≥ 1.5 W/kg (General Population) 1g
- ≥ 3.75 W/kg (General Population) 10g Extremity
- ≥ 7.5 W/kg (Occupational) 1g
- ≥ 18.75 W/kg (Occupational) 10g Extremity

The highest *reported* SAR for this evaluation is < 1.5 W/kg.

| 56.40                            | 52.72  | 6.98%     | 25.52             | 24.02   | 6.27%     |  |

Prior to the SAR evaluations, system checks were performed on the planar section of the phantom and a SPEAG validation dipole in accordance with the procedures described in IEC/IEEE 62209-1528, FCC KDB 846224

The dielectric parameters of the simulated tissue mixture were measured prior to the system performance check using a Dielectric Probe Kit and a Network Analyzer.

The forward power was applied to the dipole and the system was verified to a tolerance of +10% from the system manufacturer's dipole calibration target SAR value.

Prior to the SAR evaluations, system checks were performed on the planar section of the phantom and a SPEAG validation dipole in accordance with the procedures described in IEC/IEEE 62209-1528, FCC KDB 846224

The dielectric parameters of the simulated tissue mixture were measured prior to the system performance check using a Dielectric Probe Kit and a Network Analyzer.

The forward power was applied to the dipole and the system was verified to a tolerance of +10% from the system manufacturer's dipole calibration target SAR value.

|  | Measurement System Specification (Continued)   |  |  |  |
|--|--|--|--|--|
|  | Probe Specification  |  |  |  |
| Construction:  | Symmetrical design with triangular core; Built-in shielding against static charges PEEK enclosure material (resistant to organic solvents (e.g. DGBE)  |  |  |  |
| Calibration:   | ISO/IEC 17025  |  |  |  |
| Frequency:   | 4 MHz - 10 GHz; Linearity: ± 0.2 dB (30 MHz - 10 GHz)  |  |  |  |
|  | ± 0.1 dB in TSL (rotation around probe axis)   | The state of the s |  |  |
| Directivity:   | ± 0.3 dB in TSL (rotation normal to probe axis)  |  |  |  |
| Dynamic Range:   | 10 $\mu$ W/g to > 100 mW/g; Linearity: $\pm$ 0.2 dB (noise: typically <1 mW/g)   | J  |  |  |
|  | Overall length: 337 mm; (tip: 20 mm)   |  |  |  |
| Dimensions:  | Tip diameter: 2.5 mm; Tip (body: 12 mm)  |  |  |  |
|  | Typical distance from probe tip to dipole centers: 1 mm  |  |  |  |
| Application:   | High precision dosimetric measurements in any exposure scenario (e.g., very strong gradient fields); the only probe that enables compliance testing for frequencies up to 6 GHz with precision of better than 30%  | EX3DV4 E-Field Probe   |  |  |
|  | Phantom Specification  |  |  |  |
|  | nantom is an elliptical planar fiberglass shell phantom with a shell thickness of 2.0mm +/-<br>nar area. This phantom conforms to OET Bulletin 65, Supplement C, IEEE 1528-2013,<br>id IEC 62209-2.  | ELI Phantom  |  |  |
|  | Phantom Specification  |  |  |  |
|  | phantom is a flat planar fiberglass shell phantom with a shell thickness of 2.0mm +/- nar area. This phantom conforms to OET Bulletin 65, Supplement C, IEEE 1528-2013, id IEC 62209-2.  |  |  |  |
|  |  | SAM Phantom  |  |  |
|  | Phantom Specification  |  |  |  |
| The MFP V5.1C phantom is a flat planar fiberglass shell phantom with a shell thickness of 2.0mm +/2mm at the planar area. This phantom conforms to OET Bulletin 65, Supplement C, IEEE 1528-2013, IEC 62209-1 and IEC 62209-2. |  | 1  |  |  |
|  |  | MFP Phantom  |  |  |
|  | Device Positioner Specification  |  |  |  |
| device inclinatio<br>openings and th   | ce positioner has two scales for device rotation (with respect to the body axis) and the on (with respect to the line between the ear openings). The plane between the ear ne mouth tip has a rotation angle of 65°. The bottom plate contains three pair of bolts for ce holder. The device holder positions are adjusted to the standard measurement three sections. | Device Positioner  |  |  |

2450H/E4-A04536, Back Side , 2412MHz 802.11b 20MHz DSSS-1,WIFI/Z Scan (1x1x19): Measurement grid: dx=20mm, dy=20mm, dz=20mm

Info: Interpolated medium parameters used for SAR evaluation.

Penetration depth = n/a (n/a, 8.981) [mm]

Maximum value of SAR (interpolated) = 0.0328 W/kg

### Plot E8

DUT: A04536; Type: Transmitter; Serial: Production Sample Proto-type Procedure Name: E8-A04536, Right Side, 5180MHz UNI-I OFDM-6 20MHz,WIFI

Communication System: UID 0, CW (0); Frequency: 5180 MHz;Duty Cycle: 1:1 Medium parameters used: f = 5180 MHz;  $\sigma$  = 4.78 S/m;  $\epsilon_r$  = 32.85;  $\rho$  = 1000 kg/m³

Phantom section: Flat Section

Date/Time: 10/30/2022 3:09:40 PM

#### **DASY5** Configuration:

- Probe: EX3DV4 SN3600; ConvF(4.55, 4.55, 4.55) @ 5180 MHz; Calibrated: 4/20/2022
- Sensor-Surface: 1.4mm (Mechanical Surface Detection (Locations From Previous Scan Used)), Sensor-Surface: 1.4mm (Mechanical Surface Detection), Sensor-Surface: 4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn353; Calibrated: 4/14/2022
- Phantom: ELI V5.0 (20deg probe tilt); Type: QD OVA 002 Ax; Serial: 1234
- Measurement SW: DASY52, Version 52.10 (3); SEMCAD X Version 14.6.13 (7474)

**5250H/E8-A04536**, **Right Side**, **5180MHz UNI-I OFDM-6 20MHz,WIFI/Area Scan (9x6x1)**: Measurement grid: dx=10mm, dy=10mm Maximum value of SAR (measured) = 1.10 W/kg

5250H/E8-A04536, Right Side , 5180MHz UNI-I OFDM-6 20MHz,WIFI/Zoom Scan (9x9x6)/Cube 0: Measurement grid: dx=4mm,

dy=4mm, dz=2mm Reference Value = 7.551 V/m; Power Drift = 0.42 dB

Peak SAR (extrapolated) = 1.52 W/kg

SAR(1 g) = 0.376 W/kg; SAR(10 g) = 0.125 W/kg

Smallest distance from peaks to all points 3 dB below = 7.9 mm

Ratio of SAR at M2 to SAR at M1 = 50.7%

Maximum value of SAR (measured) = 0.881 W/kg

5250H/E8-A04536, Right Side, 5180MHz UNI-I OFDM-6 20MHz,WIFI/Z Scan (1x1x19): Measurement grid: dx=20mm, dy=20mm, dz=20mm

Penetration depth = n/a (n/a, 0) [mm]

Maximum value of SAR (interpolated) = 0.0503 W/kg
