# **FCC/ISED Test Report**

Prepared for: Garmin International, Inc.

Address: 1200 E. 151st Street

Olathe, Kansas, 66062, USA

Product: AC4308

Test Report No: R20211005-21-E14B

Approved by:

Fox Lane

**EMC Test Engineer** 

DATE: May 16, 2022

Total Pages: 62

The Nebraska Center for Excellence in Electronics (NCEE) authorizes the above named company to reproduce this report provided it is reproduced in its entirety for use by the company's employees only. Any use that a third party makes of this report, or any reliance on or decisions made based on it, are the responsibility of such third parties. NCEE accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report. This report applies only to the items tested.

# 1.0 SUMMARY OF TEST RESULTS

The worst-case measurements were reported in this report. Summary of test results presented in this report correspond to the following section:

# **FCC Part 15.247**

The EUT has been tested according to the following specifications:

- (1) US Code of Federal Regulations, Title 47, Part 15
- (2) ISED RSS-Gen, Issue 5
- (3) ISED RSS-247, Issue 2
- (4) RSS 210 Issue 10

| APPLIED STANDARDS AND REGULATIONS   |                                   |        |  |  |  |  |  |  |

# 2.0 EUT DESCRIPTION

#### 2.1 EQUIPMENT UNDER TEST

# **Summary and Operating Condition:**

| EUT                       | AC4308   |
|---------------------------|--|
| EUT Received              | 6 December 2021  |
| Test Dates                | 8 December 2021- 25 February 2022  |
| Serial No.                | 3392435319 (Radiated Measurements) 3392435300 (Conducted Measurements)                           |
| Operating Band            | 2400 – 2483.5 MHz  |
| Device Type               | ☑ GMSK □ GFSK □ BT BR □ BT EDR 2MB □ BT EDR 3MB □ 802.11x  |
| Power Supply /<br>Voltage | Internal Battery/ 5VDC Charger: Garmin (Phi Hong) MN: PSAI10R-050Q (Representative Power Supply) |

Device was tested alongside a similar unit. Worst case was reported.

NOTE: For more detailed features description, please refer to the manufacturer's specifications or user's manual.

#### 2.2 DESCRIPTION OF TEST MODES

The operating range of the EUT is dependent on the device type found in section 2.1:

**GMSK 1MB Transmissions:** 

| Channel              | Frequency |  |  |  |
|----------------------|-----------|--|--|--|
| Low                  | 2402 MHz  |  |  |  |
| Mid                  | 2440 MHz  |  |  |  |
| High                 | 2480 MHz  |  |  |  |
| OMOR OMB Towns 's s' |           |  |  |  |

**GMSK 2MB Transmissions:** 

| Channel | Frequency |
|---------|-----------|
| Low     | 2404 MHz  |
| Mid     | 2440 MHz  |
| High    | 2478 MHz  |

These are the only representative channels tested in the frequency range according to FCC Part 15.31 and RSS-Gen Table A1. See the operational description for a list of all channel frequency and designations.

#### 2.3 DESCRIPTION OF SUPPORT UNITS

None

The Nebraska Center for Excellence in Electronics 4740 Discovery Drive Lincoln, NE 68521

Report Number: R20211005-21-E14B Rev B

Prepared for: Garmin International, Inc.

# 3.0 LABORATORY AND GENERAL TEST DESCRIPTION

#### 3.1 LABORATORY DESCRIPTION

All testing was performed at the following Facility:

The Nebraska Center for Excellence in Electronics (NCEE Labs)

4740 Discovery Drive

Lincoln, NE 68521

A2LA Certificate Number: 1953.01
FCC Accredited Test Site Designation No: US1060
Industry Canada Test Site Registration No: 4294A-1
NCC CAB Identification No: US0177

Environmental conditions varied slightly throughout the tests:

Relative humidity of 35  $\pm$  4% Temperature of 22  $\pm$  3° Celsius

#### 3.2 TEST PERSONNEL

| No. | PERSONNEL      | TITLE           | ROLE                      |
|-----|----------------|-----------------|---------------------------|
| 1   | Fox Lane       | Test Engineer   | Testing and Report        |
| 2   | Karthik Vepuri | Test Engineer   | Review/Editing and Report |
| 3   | Blake Winter   | Test Engineer   | Testing                   |
| 4   | Grace Larsen   | Test Technician | Testing and Report        |
| 5   | Samuel Probst  | Test Technician | Testing and Report        |
| 6   | Matthew Emory  | Test Technician | Testing                   |

#### Notes:

All personnel are permanent staff members of NCEE Labs. No testing or review was sub-contracted or performed by sub-contracted personnel.

# 3.4 GENERAL TEST PROCEDURE AND SETUP FOR RADIO MEASUREMNTS

Measurement type presented in this report (Please see the checked box below):

# Conducted ⊠

The conducted measurements were performed by connecting the output of the transmitter directly into a spectrum analyzer using an impedance matched cable and connector soldered to the EUT in place of the antenna. The information regarding resolution bandwidth, video bandwidth, span and the detector used can be found in the graphs provided in the Appendix C. All the radio measurements were performed using the sections from ANSI C63.10, details about the section used can be found in the spectrum analyzer titles on the graph.

Figure 1 - Bandwidth Measurements Test Setup

# Radiated ⊠

All the radiated measurements were taken at a distance of 3m from the EUT. The information regarding resolution bandwidth, video bandwidth, span and the detector used can be found in the graphs provided in the Appendix C. All the radio measurements were performed using the sections from ANSI C63.10, details about the section used can be found in the spectrum analyzer titles on the graph.

# 4.1 OUTPUT POWER

**Test Method**: All the radio measurements were performed using the sections from ANSI C63.10, Sec. 11.9.2.2.4

# Limits of power measurements:

# For FCC Part 15.247 Device:

The maximum allowed output power is 30 dBm.

#### Test procedures:

Details can be found in section 3.4 of this report.

#### **Deviations from test standard:**

No deviation.

#### Test setup:

Details can be found in section 3.4 of this report.

# **EUT operating conditions:**

Details can be found in section 2.1 of this report.

# Test results:

# **Pass**

#### Comments:

- 1. All the output power plots can be found in the Appendix C.
- 2. All the measurements were found to be compliant.
- 3. Tabulated data is listed in section 4.0.

Lincoln, NE 68521 Page 11 of 62

#### 4.2 BANDWIDTH

**Test Method**: All the radio measurements were performed using the sections from ANSI C63.10, details about the section used can be found in the spectrum analyzer titles on the graph.

#### Limits of bandwidth measurements:

#### For FCC Part 15.247 Device:

The 99% occupied bandwidth is for informational purpose only. The 6dB bandwidth of the signal must be greater than 500 kHz.

#### Test procedures:

Details can be found in section 3.4 of this report.

### **Deviations from test standard:**

No deviation.

#### Test setup:

Test setup details can be found in section 3.4 of this report.

# **EUT operating conditions:**

Details can be found in section 2.1 of this report.

#### Test results:

# **Pass**

#### Comments:

- 1. All the bandwidth plots can be found in the Appendix C.
- 2. All the measurements were found to be compliant.
- 3. Tabulated data is listed in section 4.0.

#### 4.3 DUTY CYCLE

Figure 3 - Duty Cycle, GMSK 1MB

Figure 4 - Duty Cycle, GMSK 2MB

The Nebraska Center for Excellence in Electronics 4740 Discovery Drive Lincoln, NE 68521

Page 13 of 62

R20211005-21-E14B Report Number: Rev В Prepared for: Garmin International, Inc.

#### **GMSK 1MB**

DCCF For Emissions (Duty Cycle Correction Factor) = 20 \* Log(Duty Cycle) -7.74 = 20 \* Log(41.4 / 100)

DCCF For Power (Duty Cycle Correction Factor) = 10 \* Log(1 / (Duty Cycle)) 3.87 = 10 \* Log(1 / (41.4 / 100))

#### **GMSK 2MB**

DCCF For Emissions (Duty Cycle Correction Factor) = 20 \* Log(Duty Cycle ) -13.11 = 20 \* Log(22.1 / 100)

DCCF For Power (Duty Cycle Correction Factor) = 10 \* Log(1 / (Duty Cycle)) 6.56 = 10 \* Log(1 / (1 / 0.221))

Page 14 of 62

Prepared for: Garmin International, Inc.

#### **RADIATED EMISSIONS** 4.4

**Test Method**: ANSI C63.10-2013, Section 6.5, 6.6

#### Limits for radiated emissions measurements:

Emissions radiated outside of the specified bands shall be applied to the limits in 15.209 as followed:

| FREQUENCIES<br>(MHz) | FIELD<br>STRENGTH<br>(µV/m) | MEASUREMENT<br>DISTANCE (m) |
|----------------------|-----------------------------|-----------------------------|
| 0.009-0.490          | 2400/F(kHz)                 | 300                         |
| 0.490-1.705          | 24000/F(kHz)                | 30                          |
| 1.705-30.0           | 30                          | 3                           |
| 30-88                | 100                         | 3                           |
| 88-216               | 150                         | 3                           |
| 216-960              | 200                         | 3                           |
| Above 960            | 500                         | 3                           |

#### NOTE:

- 1. The lower limit shall apply at the transition frequencies.
- 2. Emission level (dBuV/m) = 20 \* log \* Emission level ( $\mu$ V/m).
- 3. As shown in 15.35(b), for frequencies above 1000MHz, the field strength limits are based on average detector, however, the peak field strength of any emission shall not exceed the maximum permitted average limits by more than 20dB under any condition of modulation.
- 4. The EUT was tested for spurious emissions while running off of battery power and external USB power. The worse-case emissions were produced while running off of USB power, so results from this mode are presented.

 Prepared for:
 Garmin International, Inc.

### Test procedures:

- a. The EUT was placed on the top of a rotating table above the ground plane in a 10 meter semi-anechoic chamber. The table was rotated 360 degrees to determine the position of the highest radiation. The table was 0.8m high for measurements from 30MHz-1Ghz and 1.5m for measurements from 1GHz and higher.
- b. The EUT was set 3 meters away from the interference-receiving antenna, which was mounted on the top of a variable-height antenna tower.
- c. The antenna was a broadband antenna, and its height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are used to make the measurement.
- d. For each suspected emission, the EUT was arranged to maximize its emissions and then the antenna height was varied from 1 meter to 4 meters and the rotating table was turned from 0 degrees to 360 degrees to find the maximum emission reading.
- e. The test-receiver system was set to use a peak detector with a specified resolution bandwidth. For spectrum analyzer measurements, the composite maximum of several analyzer sweeps was used for final measurements.
- f. If the emission level of the EUT in peak mode was 10dB lower than the limit specified, then testing could be stopped and the peak values of the EUT would be reported. Otherwise, the emissions that did not have 10 dB margin would be re-tested one by one using peak, quasi-peak or average method as specified and then reported in a data sheet.
- g. The EUT was maximized in all 3 orthogonal positions. The results are presented for the axis that had the highest emissions.

### Test setup:

Figure 5 - Radiated Emissions Test Setup

#### NOTE:

- 1. The resolution bandwidth and video bandwidth of test receiver/spectrum analyzer is 120kHz for Peak detection (PK) and Quasi-peak detection (QP) at frequencies below 1GHz.
- 2. The resolution bandwidth 1 MHz for all measurements and at frequencies above 1GHz, A peak detector was used for all measurements above 1GHz. Measurements were made with an EMI Receiver.

#### **Deviations from test standard:**

No deviation.

#### **EUT operating conditions**

Details can be found in section 2.1 of this report.

# 4.5 CONDUCTED SPURIOUS EMISSIONS

Test Method: ANSI C63.10-2013, Section 6.7

#### Limits of spurious emissions:

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in § 15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in § 15.205(a), must also comply with the radiated emission limits specified in § 15.209(a) (see § 15.205(c)).

#### Test procedures:

The highest emissions level was measured and recorded. All spurious measurements were evaluated to 30dB below the fundamental. More details can be found in section 3.4 of this report. The line shown in the plots is not a limit line, it is a reference line placed at -20dBm.

#### **Deviations from test standard:**

Test was performed with 120kHz RBW

## Test setup:

Test setup details can be found in section 3.4 of this report.

#### **EUT** operating conditions:

Details can be found in section 2.1 of this report.

### 4.6 BAND EDGES

**Test Method**: All the radio measurements were performed using the sections from ANSI C63.10, details about the section used can be found in the spectrum analyzer titles on the graph.

#### Limits of band-edge measurements:

#### For FCC Part 15.247 Device:

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.205(c))

#### Test procedures:

The highest emissions level beyond the band-edge was measured and recorded. All band edge measurements were evaluated to the general limits in Part 15.209. More details can be found in section 3.4 of this report.

#### **Deviations from test standard:**

No deviation.

# Test setup:

Test setup details can be found in section 3.4 of this report.

#### **EUT operating conditions:**

Details can be found in section 2.1 of this report.

# Test results:

# **Pass**

# Comments:

- 1. All the band edge plots can be found in the Appendix C.
- 2. If the device falls under FCC Part 15.247 (Details can be found in summary of test results), compliance is shown in the unrestricted band edges by showing minimum delta of 20 dB between peak and the band edge.
- 3. The restricted band edge compliance is shown by comparing to the general limit defined in Part 15.209. The limit shown in the graph accounts for the antenna gain of the device.

# 4.7 POWER SPECTRAL DENSITY

**Test Method**: All the radio measurements were performed using the sections from ANSI C63.10, details about the section used can be found in the spectrum analyzer titles on the graph.

#### Limits of power measurements:

#### For FCC Part 15.247 Device:

The maximum PSD allowed is 8 dBm.

# Test procedures:

Details can be found in section 3.4 of this report.

#### **Deviations from test standard:**

No deviation.

#### Test setup:

Details can be found in section 3.4 of this report.

#### **EUT operating conditions:**

Details can be found in section 2.1 of this report.

#### Test results:

# **Pass**

#### Comments:

- 1. All the Power Spectral Density (PSD) plots can be found in the Appendix C.
- 2. All the measurements were found to be compliant.
- 3. Tabulated data is listed in section 4.0.

# 4.8 CONDUCTED AC MAINS EMISSIONS

Test Method: ANSI C63.10-2013, Section(s) 6.2

#### Limits for conducted emissions measurements:

| FREQUENCY OF EMISSION (MHz) | CONDUCTED LIMIT (dBµV) |          |  |
|-----------------------------|------------------------|----------|--|
|                             | Quasi-peak             | Average  |  |
| 0.15-0.5                    | 66 to 56               | 56 to 46 |  |
| 0.5-5                       | 56                     | 46       |  |
| 5-30                        | 60                     | 50       |  |

#### Notes:

- 1. The lower limit shall apply at the transition frequencies.
- 2. The limit decreases in line with the logarithm of the frequency in the range of 0.15 to 0.50 MHz
- 3. All emanations from a class A/B digital device or system, including any network of conductors and apparatus connected thereto, shall not exceed the level of field strengths specified above.

#### **Test Procedures:**

- a. The EUT was placed 0.8m above a ground reference plane and 0.4 meters from the conducting wall of a shielded room with EUT being connected to the power mains through a line impedance stabilization network (LISN). The LISN provides 50 ohm/ 50uH of coupling impedance for the measuring instrument.
- b. Both lines of the power mains connected to the EUT were checked for maximum conducted interference as well as the ground.
- c. The frequency range from 150 kHz to 30 MHz was searched. Emission levels over 10dB under the prescribed limits are not reported.
- d. Results were compared to the 15.207 limits.

#### Deviation from the test standard:

No deviation

#### **EUT operating conditions:**

Details can be found in section 2.1 of this report.

# APPENDIX A: SAMPLE CALCULATION

# **Field Strength Calculation**

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. The basic equation with a sample calculation is as follows:

$$FS = RA + AF - (-CF + AG) + AV$$

where FS = Field Strength

RA = Receiver Amplitude

AF = Antenna Factor

CF = Cable Attenuation Factor

AG = Amplifier Gain

AV = Averaging Factor (if applicable)

Assume a receiver reading of 55 dB $\mu$ V is obtained. The Antenna Factor of 12 and a Cable Factor of 1.1 is added. The Amplifier Gain of 20 dB is subtracted, giving a field strength of 48.1 dB $\mu$ V/m.

$$FS = 55 + 12 - (-1.1 + 20) + 0 = 48.1 dB\mu V/m$$

The 48.1 dBμV/m value can be mathematically converted to its corresponding level in μV/m.

Level in  $\mu V/m = Common Antilogarithm [(48.1 dB<math>\mu V/m$ )/20]= 254.1  $\mu V/m$ 

AV is calculated by the taking the  $20*log(T_{on}/100)$  where  $T_{on}$  is the maximum transmission time in any 100ms window.

The Nebraska Center for Excellence in Electronics 4740 Discovery Drive Lincoln, NE 68521

|----------------|----------------------------|-----|---|
| Prepared for:  | Garmin International, Inc. |     |   |

# **EIRP Calculations**

In cases where direct antenna port measurement is not possible or would be inaccurate, output power is measured in EIRP. The maximum field strength is measured at a specified distance and the EIRP is calculated using the following equation;

EIRP (Watts) = [Field Strength (V/m) x antenna distance (m)] $^2$  / 30

Power (watts) =  $10^{Power} (dBm)/10 / 1000$ 

Voltage  $(dB\mu V)$  = Power (dBm) + 107 (for 50 $\Omega$  measurement systems)

Field Strength  $(V/m) = 10^{field Strength} (dB\mu V/m) / 20] / 10^6$ 

Gain = 1 (numeric gain for isotropic radiator)

Conversion from 3m field strength to EIRP (d=3):

 $EIRP = [FS(V/m) \times d^2]/30 = FS[0.3]$  for d = 3

 $EIRP(dBm) = FS(dB\mu V/m) - 10(log 10^9) + 10log[0.3] = FS(dB\mu V/m) - 95.23$ 

10log( 10^9) is the conversion from micro to milli

Lincoln, NE 68521 Page 34 of 62

# APPENDIX B - MEASUREMENT UNCERTAINTY

Where relevant, the following measurement uncertainty levels have been for tests performed in this test report:

| Test                        | Frequency Range | Uncertainty Value (dB) |
|-----------------------------|-----------------|------------------------|
| Radiated Emissions, 3m      | 30MHz - 1GHz    | 3.82                   |
| Radiated Emissions, 3m      | 1GHz - 18GHz    | 4.44                   |
| Emissions limits, conducted | 30MHz – 18GHz   | ±3.30 dB               |

Expanded uncertainty values are calculated to a confidence level of 95%.
