Date of Issue: December 19, 2014

According to KDB 447498 section 4.3.1, the 1-g SAR test exclusion thresholds at test separation distance \leq 50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)] *·[f(GHz)] ≤ 3.0

The tune-up power is 6 dBm +/- 2dB, therefore the highest tune-up power is 5.19 dBm (3.30 mW) @ 2402 MHz

When the minimum *test separation distance* is < 5 mm, a distance of 5 mm according to 5) in section 4.1 is applied to determine SAR test exclusion.

So,

 $(3.30 \text{mW} / 5 \text{mm}) * (2.402 \text{GHz} ^0.5) = 1.0$

[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)] * [f(GHz)] = 1.0 < 3.0

Therefore, standalone SAR measurements are not required for both head and body.
