

No, I do not have access to METrak from here- please email to me the internal and external photos.

Actually, for this device, Section 15.109 is correct, as it covers the peripheral portion of the EUT. The transmitter portion is Part 90, so 15.209 does not apply. If the EUT can be operated while it is connected to a pc, then it meets the definition of a pc peripheral, so, yes, the retest should be done for 15.109 compliance with the minimum test configuration required by ANSI C63.4. When you have completed it, please mail the updated Part 15 test report to me as well, and I will recommend that the application be granted. I do not have to see the Part 90 test report again, once you have made the required updates re antenna gain and emission designator.

Gregory Czumak
