

The theory of operation and the installation manual both state that the EUT may be "controlled or monitored locally via RS232." This sounds as though it is used as a pc peripheral for more than just configuration purposes during installation. If this is the case, then the Part 15B tests must be reperformed. If, on the other hand, it is only used for configuration purposes during installation, and not for control and monitoring, then the test would not have to be repeated, however, the theory of operation and the installation manual must both be amended to remove the reference to control and monitoring. Please address.
