Re: Class II permissive change  
FCC ID: IYGRCU200

Dear Sirs:

We have a need for a lower power output version of the above referenced unit. For these cases we propose to simply place a resistive attenuator on the printed circuit board before the feed to the internal antenna. The model number of the unit will be changed to reflect the lower power versions. All changes are internal to the unit and are not accessible to the user.

The only measurement data that is affected by this change is the RF power output which has been measured at 0dBm. All other characteristics reported to and approved by the commission are not affected by this change.

Thank you for your consideration in this matter and if further clarification is needed please contact me.

Regards,

Steven L. Maddy
