LEX-M01-002 Radio Power Setting

Transmit power for the Lexmark LEX-M01-002 WLAN module is set via printer firmware. This setting, 17dBm maximum, is selected by our firmware and does not normally change across different channel or data rate. The only possible change to Tx power is a slight lowering, perhaps to 15dBm, by our transmit power control algorithm. This algorithm is only invoked at the 11Mbps and 54Mbps data rates and will never use a Tx power greater than 17dBm.
