LEX-M01-004 Radio Power Setting

Transmit power for the Lexmark LEX-M01-004 WLAN module is set via printer firmware. This setting (16dBm for all data rates maximum) is selected by our firmware and does not normally change across different channel or data rate. The only possible change to Tx power is a slight lowering, perhaps to 15dBm, by our transmit power control algorithm. This algorithm will never use a Tx power greater than 16dBm.
