

## **PRELIMINARY MPE TEST RESULTS OF WSAP5000 ACCESS POINT**

### **1. Purpose**

This test method is used to verify that the DUI meets the MPE requirements as defined in the criteria for general population/uncontrolled exposure when operating at maximum ERP and in all operating modes.

### **2. Criteria**

Power Density Limits – The DUI shall not generate a power density beyond the limit of 1 mW/cm<sup>2</sup>. The power density shall be measured at a distance of 20 cm from the radiating antenna axis while the unit is in both vertical and flat configuration as shown in figure 1 and figure 2. The measured values shall be recorded.

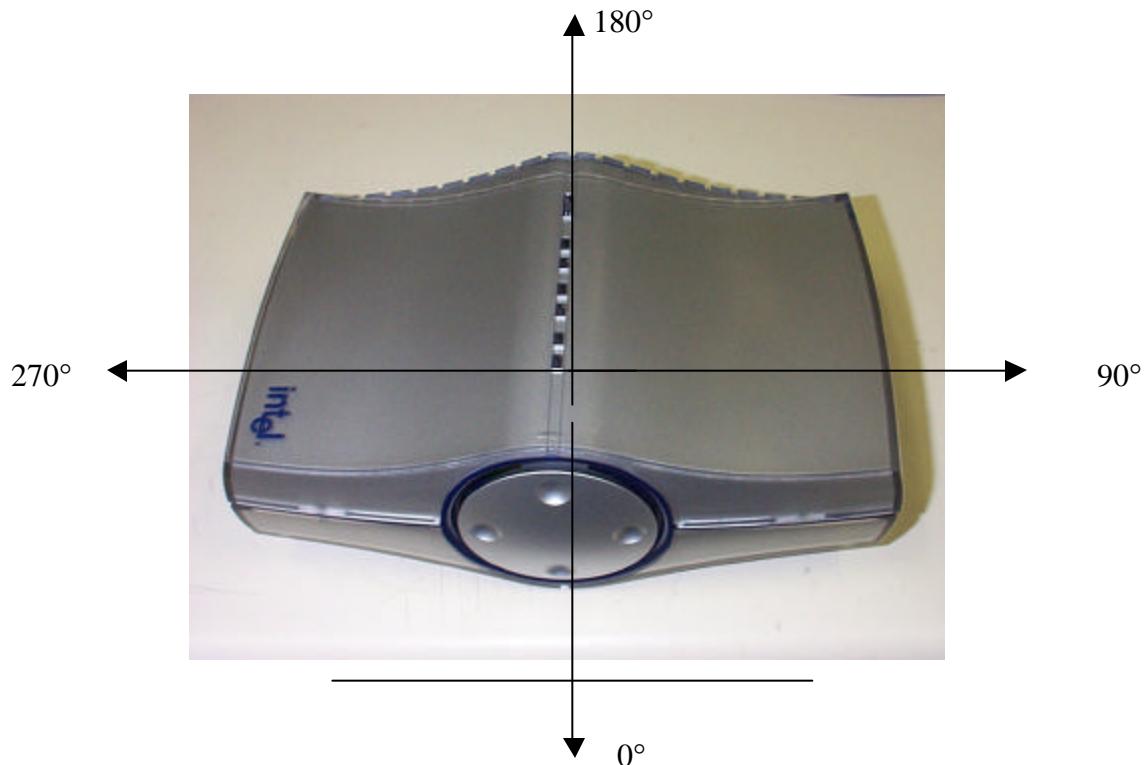

Figure 1 Flat configuration

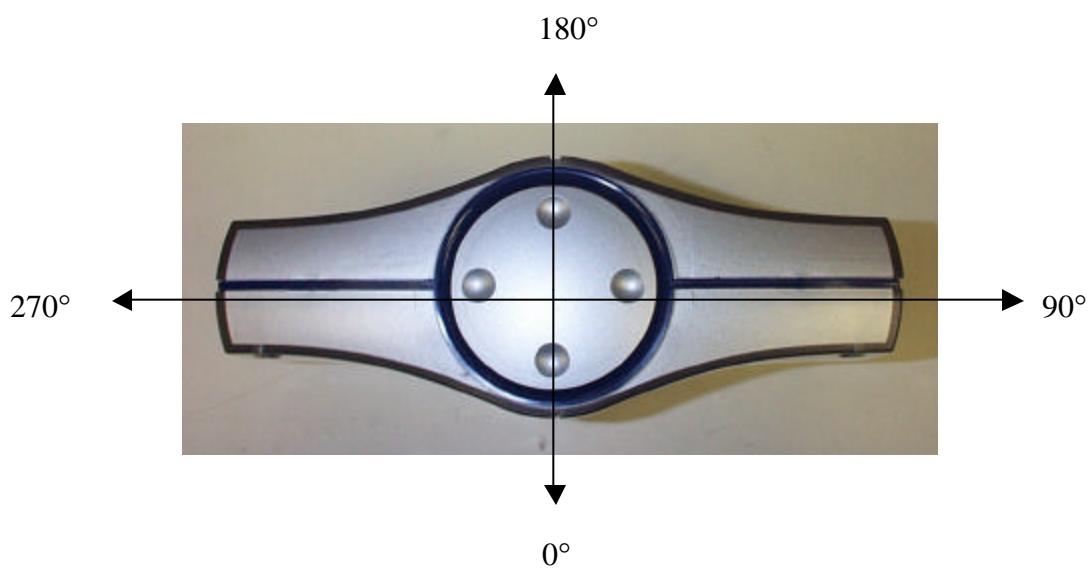

Figure 2 Vertical configuration

### 3 Results

Table 1 presents the results of the measurements made vertically along the DUI in order to find the location of the maximum power density.

**Table 1.1**  
 Power Density Measured at 0° as a Function of Height

#### 4. Conclusion

All reading recorded are below the above limit of **1 mW/cm<sup>2</sup>**.
