APPLICABLE STANDARDS						
STANDARD	TEST RESULTS					
FCC PART 27 SUBPART L	Pass					
IC RSS-139 ISSUE 2	Pass					

Compliance Certification Services, Inc. (CCS) tested the above equipment in accordance with the requirements set forth in the above standards. All indications of Pass/Fail in this report are opinions expressed by CCS based on interpretations and/or observations of test results. Measurement Uncertainties were not taken into account and are published for informational purposes only. The test results show that the equipment tested is capable of demonstrating compliance with the requirements as documented in this report.

Note: The results documented in this report apply only to the tested sample, under the conditions and modes of operation as described herein. This document may not be altered or revised in any way unless done so by CCS and all revisions are duly noted in the revisions section. Any alteration of this document not carried out by CCS will constitute fraud and shall nullify the document. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, any agency of the Federal Government, or any agency of any government.

Page 4 of 45

2. TEST METHODOLOGY

The tests documented in this report were performed in accordance with RSS-GEN, RSS-139 Issue 1 and FCC CFR 47 Part 2, and FCC CFR 47 Part 27.

3. FACILITIES AND ACCREDITATION

The test sites and measurement facilities used to collect data are located at 47173 Benicia Street, Fremont, California, USA.

CCS is accredited by NVLAP, Laboratory Code 200065-0. The full scope of accreditation can be viewed at <u>http://ts.nist.gov/Standards/scopes/2000650.htm.</u>

4. CALIBRATION AND UNCERTAINTY

4.1. MEASURING INSTRUMENT CALIBRATION

The measuring equipment utilized to perform the tests documented in this report has been calibrated in accordance with the manufacturer's recommendations, and is traceable to recognized national standards.

4.2. MEASUREMENT UNCERTAINTY

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the apparatus:

PARAMETER	UNCERTAINTY
Radiated Emission, 30 to 200 MHz	+/- 3.3 dB
Radiated Emission, 200 to 1000 MHz	+4.5 / -2.9 dB
Radiated Emission, 1000 to 2000 MHz	+4.5 / -2.9 dB
Power Line Conducted Emission	+/- 2.9 dB

Uncertainty figures are valid to a confidence level of 95%.

Page 5 of 45

5. EQUIPMENT UNDER TEST

5.1. DESCRIPTION OF EUT

The EUT is an 802.11bg, BT, WWAN Combo Module.

Fenway is a ruggedized Win Mobile PDA device for the Vertical and Enterprise markets. Fenway will deliver WWAN connectivity solutions for the UMTS HSDPA and HSUPA, and GSM/GPRS/EDGE protocols in one hardware configuration.

In the US and Canada, only 850 MHz (Cellular), 1700 MHz (AWS) and 1900 MHz (PCS) bands are used for WCDMA and GSM operation. The EUT was only tested in those three bands for FCC application.

5.2. DESCRIPTION OF AVAILABLE ANTENNAS

The radio utilizes a Magnetic Mount triple-frequency Mobile antenna with a maximum gain of 0 dBi.

Page 6 of 45

7. TEST SUMMARY

	Description of test		Results	
	Description of test	FCC	IC	Tresuits
1.	RF Power Output	§2.1046,	RSS-139	Complies
2.	Occupied Bandwidth	§2.1049	RSS-Gen, 4.6	
3.	Block Edge (Band Edge)	§27.53	RSS-139, 6.5	Complies
4.	Out of Band Emissions	§2.1051, §27.53	RSS-139, 6.5	Complies
5.	Frequency Stability	§2.1055, §27.54	RSS-139, 6.3	Complies
6.	Radiated Power (ERP & EIRP)	§2.1046, §27.50(d) (2)	RSS-139, 6.4	Complies
7.	Field Strength of Spurious Radiation	§2.1053, §24.53	RSS-139, 6.5	Complies
8.	Receiver Spurious Emissions (IC only)	n/a	RSS-139, 6.6 RSS-Gen	Complies

8. MAXIMUM OUTPUT POWER

The transmitter has a maximum output power as follows:

Part 27 UMTS Band IV

Frequency range (MHz)	Modulation	Conducted		EIRP	
Frequency range (Miriz)	wouldtion	dBm	mW	dBm	mW
1710 – 1755	UMTS - Rel 99	28.8	756.8	27.5	562.3
1710 - 1755	UMTS - HSDPA	29.2	822.2	27.8	602.6

Page 11 of 45

9. RF POWER OUTPUT VERIFICATION

RULE PART(S)

FCC: §2.1046 IC: RSS-139, 6.4

LIMITS

For reporting purposes only

TEST PROCEDURE

The transmitter output was connected to an Agilent 8960Test Set and configured to operate at maximum power in a call. The peak power was measured using the spectrum analyzer at three equally spaced operating frequencies for each band. The RBW was set to 300 KHz for the GSM and EDGE measurements and 5 MHz for the UMTS (WCDMA) measurements.

MODES TESTED

• UMTS (W-CDMA) - Rel 99, Rel 6 HSDPA and HSPA (HSDPA & HSUPA)

<u>RESULTS</u>

See Section 9.1 to 9.3

Page 12 of 45

9.1. RF POWER OUTPUT FOR UMTS REL99

The following tests were completed according to the test requirements outlined in section 5.2 of the 3GPP TS34.121-1 V7.5.0 specification. The EUT supports power Class 3, which has a nominal maximum output power of 24 dBm (+1.7/-3.7) 12.2kps RMC is used for this testing. Power control set to All bits up. A summary of these settings are illustrated below:

	Mode	Rel99
	Subtest	-
	Loopback Mode	Test Mode 1
	Rel99 RMC	12.2kbps RMC

10. WORST-CASE CONFIGURATION AND MODE

Based on the following investigation results, see Section 6. RF POWER OUTPUT VERIFCATION. The highest peak power and enhanced data rate is the worst-case scenario for all measurements.

Worst case modes:

- Rel 99
 - o Rel 6 HSDPA Subtest 2

Page 17 of 45

11. CONDUCTED TEST RESULTS

11.1. OCCUPIED BANDWIDTH

RULE PART(S)

FCC: §2.1049 IC: RSS-Gen, 4.6

LIMITS

For reporting purposes only

TEST PROCEDURE

The transmitter output was connected to a calibrated coaxial cable and coupler, the other end of which was connected to a spectrum analyzer. The occupied bandwidth was measured with the spectrum analyzer at the low, middle and high channel in each band. The –26dB bandwidth was also measured and recorded.

MODES TESTED

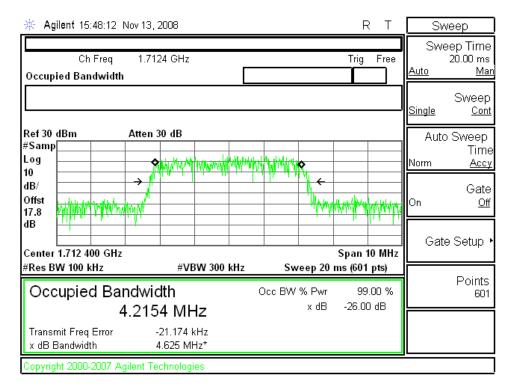

• UMTS (W-CDMA) - Rel 99, Rel 6 HSDPA Subtest 2

RESULTS

11.2. BAND EDGE

RULE PART(S)

FCC: §27.53 IC: RSS-139, 6.5

LIMITS

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least 43 + 10 log (P) dB.

TEST PROCEDURE

The transmitter output was connected to a Agilent 8960 Test Set and configured to operate at maximum power. The band edge emissions were measured at the required operating frequencies in each band on the Spectrum Analyzer.

For each band edge measurement:

- Set the spectrum analyzer span to include the block edge frequency (1710 MHz and 1755 MHz)
- Set a marker to point the corresponding band edge frequency in each test case.
- Set display line at -13 dBm
- Set resolution bandwidth to at least 1% of emission bandwidth.

MODES TESTED

- GSM GSM (GSMK) & EGPRS (8PSK),
- UMTS (W-CDMA) Rel 99, Rel 6 HSDPA Subtest 2

11.3. OUT OF BAND EMISSIONS

RULE PART(S)

FCC: §2.1051, §27.53 IC: RSS-139, 6.5

LIMITS

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log (P) dB$.

TEST PROCEDURE

The RF output of the transmitter was connected to a spectrum analyzer through a calibrated coaxial cable. Sufficient scans were taken to show the out-of-band Emissions, if any, up to 10th harmonic. Multiple sweeps were recorded in maximum hold mode using a peak detector to ensure that the worst-case emissions were caught.

For each out of band emissions measurement:

- Set display line at -13 dBm
- Set RBW & VBW to 100 kHz for the measurement below 1 GHz, and 1 MHz for the measurement above 1 GHz.

MODES TESTED

11.4. FREQUENCY STABILITY

RULE PART(S)

FCC: §2.1055, §27.54 IC: RSS-139, 6.3

LIMITS

The frequency stability shall be sufficient to ensure that the fundamental emissions stay within the authorized bands of operation.

TEST PROCEDURE

Use Agilent 8960 with Frequency Error measurement capability.

- Temp. = -20° to $+50^{\circ}$ C
- Voltage = 3.3 Vdc
- 3.0 3.6 Vdc (85% 115%)

Frequency Stability vs Temperature:

The EUT is place inside a temperature chamber. The temperature is set to 20°C and allowed to stabilize. After sufficient soak time, the transmitting frequency error is measured. The temperature is increased by 10 degrees, allowed to stabilize and soak, and then the measurement is repeated. This is repeated until +50°C is reached. Reference power supply voltage for these tests is 3.3 Vdc.

Frequency Stability vs Voltage:

The peak frequency error is recorded (worst-case). The test voltages are 3.0 to 3.6 Vdc.

MODES TESTED

• UMTS (W-CDMA) - Rel 99

12.2. FIELD STRENGTH OF SPURIOUS RADIATION

RULE PART(S)

FCC: §2.1053, §27.53 IC: RSS-139, 6.5

LIMIT

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least 43 + 10 log (P) dB.

TEST PROCEDURE

Compliance with these rules is based on the use of measurement instrumentation employing a resolution bandwidth of 1 MHz or greater. However, in the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. A narrower resolution bandwidth is permitted in all cases to improve measurement bandwidth (i.e. 1 MHz or 1 percent of emission bandwidth, as specified). The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

12.3. RECEIVER SPURIOUS EMISSIONS

RULE PART(S)

FCC: N/A IC: RSS-139, 6.6, RSS-Gen

LIMIT

RSS-Gen 6 (a) - If a radiated measurement is made, all spurious emissions shall comply with the limits of Table 1.

Table 1 - Spurious Emission Limits for Receivers:

Spurious Frequency (MHz)	Field Strength(microvolt/m at 3 meters)
30 - 88	100
88 - 216	150
216 - 960	200
Above 960	500

TEST PROCEDURE

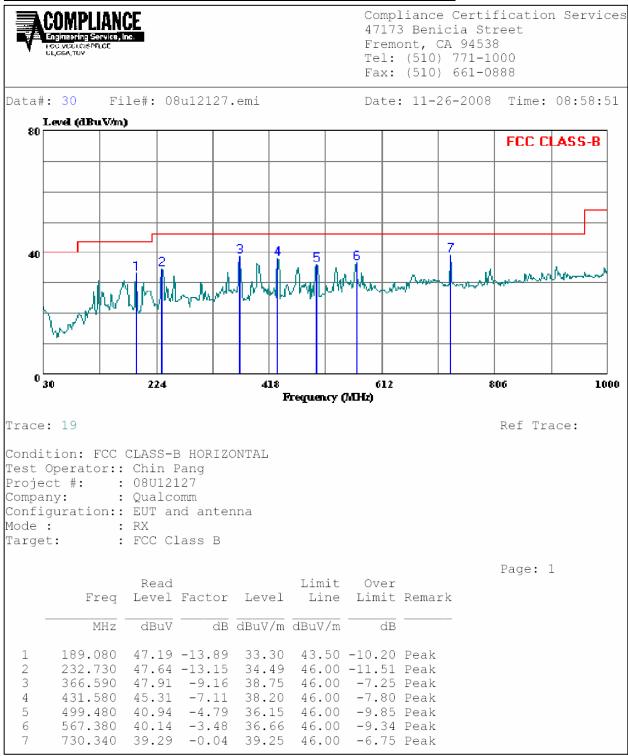

RSS-Gen 4.10 - The search for spurious emissions shall be from the lowest frequency internally generated or used in the receiver (e.g. local oscillator, intermediate or carrier frequency), or 30 MHz, whichever is the higher, to at least 3 times the highest tuneable or local oscillator frequency, whichever is the higher, without exceeding 40 GHz.

RESULTS

See the following pages.

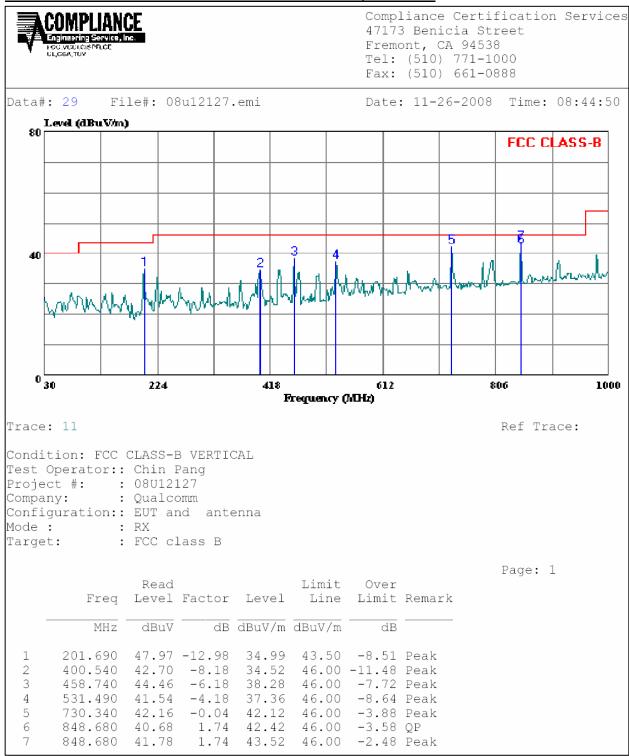

Page 38 of 45

RECEIVER SPURIOUS EMISSIONS FOR 30 TO 1000 MHz, HORIZONTAL

Page 39 of 45

RECEIVER SPURIOUS EMISSIONS FOR 30 TO 1000 MHz, VERTICAL

Page 40 of 45

MAXIMUM PERMISSIBLE EXPOSURE 13.

LIMITS

§1.1310 The criteria listed in Table 1 shall be used to evaluate the environmental impact of human exposure to radio-frequency (RF) radiation as specified in §1.1307(b), except in the case of portable devices which shall be evaluated according to the provisions of §2.1093 of this chapter.

			. ,	
Frequency range (MHz)	Electric field strength (V/m)	Magnetic field strength (A/m)	Power density (mW/cm²)	Averaging time (minutes)
(A) Lim	its for Occupational	/Controlled Exposu	res	
0.3–3.0 3.0–30 30–300 300–1500 1500–100,000	614 1 <i>8</i> 42# 61.4	1.63 4.89/f 0.163	*(100) *(900/f²) 1.0 f/300 5	6 6 6
(B) Limits	for General Populati	on/Uncontrolled Exp	posure	
0.3–1.34 1.34–30	614 824/f	1.63 2.19/f	*(100) *(180/f ²)	30 30

TABLE 1—LIMITS FOR MAXIMUM PERMISSIBLE EXPOSURE (MPE)

TABLE 1—LIMITS FOR MAXIMUM PERMISSIBLE EXPOSURE (MPE)—Continued

Frequency range (MHz)	Electric field strength (V/m)	Magnetic field strength (A/m)	Power density (mW/cm²)	Averaging time (minutes)
30–300	27.5	0.073	0.2 f/1500	30 30
1500–100,000			1.0	30

f = frequency in MHz

 * = Plane-wave equivalent power density
 NOTE 1 TO TABLE 1: Occupational/controlled limits apply in situations in which persons are exposed as a consequence of their employment provided those persons are fully aware of the potential for exposure and can exercise control over their exposure. Limits for occupational/controlled exposure also apply in situations when an individual is transient through a location where occu-

pational/controlled limits apply provided he or she is made aware of the potential for exposure. NOTE 2 TO TABLE 1: General population/uncontrolled exposures apply in situations in which the general public may be ex-posed, or in which persons that are exposed as a consequence of their employment may not be fully aware of the potential for exposure or can not exercise control over their exposure.

Page 41 of 45

CALCULATIONS

Given

 $E = \sqrt{(30 * P * G)} / d$

and

S = E ^ 2 / 3770

where

E = Field Strength in Volts/meter

P = Power in Watts

G = Numeric antenna gain

d = Distance in meters

S = Power Density in milliwatts/square centimeter

Combining equations and rearranging the terms to express the distance as a function of the remaining variables yields:

 $d = \sqrt{((30 * P * G) / (3770 * S))}$

Changing to units of Power to mW and Distance to cm, using:

P(mW) = P(W) / 1000 and d (cm) =100 * d (m) vields d = 100 * √ ((30 * (P / 1000) * G) / (3770 * S)) $d = 0.282 * \sqrt{(P * G / S)}$ where d = distance in cmP = Power in mWG = Numeric antenna gain S = Power Density in mW/cm² Substituting the logarithmic form of power and gain using: $P(mW) = 10^{(P(dBm))} / 10)$ and G (numeric) = 10 ^ (G (dBi) / 10) vields $d = 0.282 * 10^{(P + G)} / 20) / \sqrt{S}$ Equation (1) where d = MPE distance in cm P = Power in dBm G = Antenna Gain in dBi

S = Power Density Limit in mW/cm²

Equation (1) and the measured peak power is used to calculate the MPE distance.

LIMITS

From §1.1310 Table 1 (B), S = 0.549 mW/cm² (Cell) and 1.0 mW/cm² (PCS)

<u>RESULTS</u>

No non-compliance noted: (MPE distance equals 20 cm)

	MPE	Output	Antenna	Power	FCC MPE
Modulation	Distance	Power	Gain	Density	Limit
	(cm)	(dBm)	(dBi)	(mW/cm^2)	(mW/cm^2)
UMTS - Rel 99	20.0	28.80	0.00	0.151	1.0
UMTS - HSDPA	20.0	29.20	0.00	0.165	1.0

NOTE: For mobile or fixed location transmitters, the minimum separation distance is 20 cm, even if calculations indicate that the MPE distance would be less.
