1. Test summary

1.1 Equipment tested

A Gobi2000™ module WWAN mPCIe card embedded in a Dell® Latitude™ XT2 (regulatory model PP12S) tablet notebook computer was tested for SAR compliance with FCC regulations.

The XT2 computer also has embedded Bluetooth and WLAN capabilities that were not tested as part of this test report. While simultaneous transmission is enabled, it is not evaluated in this report; collocation is addressed in a separate report.

Because this is a tablet computer, it was tested in accordance with the FCC publication *Mobile and Portable Device – RF Exposure Procedures and Equipment Authorization Policies* (KDB 447498).

1.2 Maximum (Worst Case Results)

3. Conducted Transmit Power Results

Conducted transmit power was tested in accordance with FCC 3G procedures, 3GPP and 3GPP2 standards. The test procedure for configuring the EUT to transmit at maximum output power is in section 9.

All transmit power results are based on an average detector. The rationale and calculations determining the SAR configurations tested per the FCC procedure are detailed in Section 4. *SAR Test Matrix*.

4. SAR Test Matrix

Table 4-1 describes the SAR configurations tested for the EUT and host notebook described in this report per the FCC. The configurations tested are based on the calculations in Table 4-3 below that are based on evaluation requirements summarized in Table 2 of the FCC procedure *SAR Evaluation Considerations for Laptop Computers with Antennas Built-in on Display Screens* (KDB 616217 D01) released in November of 2009. The conducted powers used in the separation distance calculations are summarized in Table 4-2 below, which represents the highest transmit power test results from the conducted power data documented in this report. Per the FCC 3G Measurement procedures, modes have been omitted from Table 4-2 for the following reasons.

- Per FCC 3G 1x procedures, all modes have been eliminated that are less than 0.25dB greater than 1x RC3 (SO55)
- Per the FCC 3G procedures EV-DO Rev A has been omitted since the maximum transmit power results are less than the 1x RC3 and EV-DO Rel 0 test results.
- Per the FCC 3G procedures, HSDPA and HSUPA have been omitted since the maximum transmit power results are less than the R99 test results.

All SAR configurations are based on calculations for an individual transmitter or antenna. Simultaneous transmitter considerations have not been completed for these reasons:

- WWAN does not transmit simultaneously with WLAN
- Bluetooth Power is $<60/f_{\text{(GHz)}}$

Based on the high margin to the SAR limit, only the modes with the highest transmit power were tested. The conducted transmit power of other modes not tested for SAR were equal to or less than the modes tested for SAR and thus the tested SAR results are representative of the untested modes.

Table 4-1 SAR Testing Completed per FCC Laptop Procedures

Mode	Band	Channels	Rationale
GPRS 2UL	850 MHz	Low/mid/high	Test low/middle/high channels since the antenna-to-user separation distance provided by the host notebook computer is less than the calculated minimum antenna-to-user distance per Table 2 of FCC procedure.
EV-DO R0	1900 MHz	Low/mid/high	Test low/middle/high channels since the antenna-to-user separation distance provided by the host notebook computer is less than the calculated minimum antenna-to-user distance per Table 2 of FCC procedure.

Humidity Range	25-75% (38% actual)
Pressure	860-1060 mbar (1015 mB)

All Qualcomm dosimetry equipment is operated within a shielded screen room manufactured by Lindgren RF Enclosures to provide isolation from external EM fields. The E-field probes of the DASY5 system are capable of detecting signals as low as $5\mu\text{W/g}$ in the liquid dielectric, and so external fields are minimized by the screen room, leaving the phone as the dominate radiation source. The floor of the screen room is reflective, so the phantom bench is placed on two ferrite panels measuring 2 ft^2 each, in order to minimize reflected energy that would otherwise re-enter the phantom and combine constructively or destructively with the desired results.

5.2 Dosimetry System

The dosimetry equipment consists of a complete state-of-the-art DASY5 dosimetry system manufactured and calibrated by Schmid & Partner Engineering AG of Zurich, Switzerland. The DASY5 system consists of a six axis robot, a robot controller, a teach pendant, automation software on a 3.16 GHz Intel Core2® Duo CPU E8500 computer, data acquisition system, isotropic E-field probe, device positioning holder, and validation kit. The positioner was designed specifically for positioning laptops, and is made of low-loss materials: POM, acrylic glass and foam.

Figure 3-1 shows the robot arm, controller box and device-positioning holder.

Figure 3-1 DASY5 system: Robot Arm, Controller box, Device Positioning Holder

5.3 E-field probe

Manufactured by Schmid & Partner, Model ET3DV6. Calibrated by the manufacturer in head tissue simulating liquid at frequencies ranging from 835 MHz to 1.95 GHz. Dynamic range is said by the manufacturer to be $5 \mu\text{W/gm}$ to approx. 100 mW/g . The probe contains 3 small dipoles positioned symmetrically on a triangular core to provide for isotropic detection of the field. Each dipole contains a diode at the feed point that converts the RF signal to DC, which is conducted down a high impedance line to the data acquisition system.

5.4 Phantom

The phantom is the Standard Anthropomorphic Model (“SAM”) phantom supplied by Schmid & Partner AG, and is designed for compliance to the guidelines provided in standard IEEE P1528. It consists of a left and right side head for simulating phone usage on both sides of the head, as well as a flat area for simulating phone usage against the body. The phantom is constructed of fiberglass with $2 \text{ mm} \pm 0.1 \text{ mm}$ shell thickness. The DASY5 system uses a homogeneous tissue phantom based on studies concerning energy absorption of the human head, and the different absorption rates between adults and children. These studies indicated that a homogeneous phantom should overestimate SAR by no more than 15% for 10 g averages and should not underestimate SAR.

Figure 3-2 shows the SAM phantom.

Figure 3-2 SAM Phantom

5.5 Liquid Dielectric

The tissue-simulating liquid filling the phantom is mixed by Qualcomm staff per manufacturer instructions and regulatory standards. There are separate formulas for the various applicable frequencies. Before the test, the permittivity and conductivity were measured with an automated Hewlett-Packard 85070B dielectric probe in conjunction with an H-P 8752C network analyzer to monitor permittivity change due to evaporation and settling of ingredients. The electromagnetic parameters of the liquid were maintained as shown in Tables 3-1. The target values were obtained from FCC OET Publication 65, Supplement C.

7. SAR Measurement Procedure

7.1 EUT Configuration

The EUT was configured into the desired transmit configuration per the procedures defined in section 9.

7.2 Power Verification

Prior to beginning SAR testing, conducted power was measured on the Gobi2000 module embedded in the host computer to verify functionality and the WWAN maximum transmit power values using the procedures defined in section 9. The results of the conducted power measurements are found in section 3.

7.3 Test Configurations

7.3.1 EUT Position

The host computer was NOT tested in the lap-held position as shown in Figure 7-1 since the WWAN antenna is > 20 cm from the user in this position.

7.4 Scan procedure

The scan routine is set up as follows:

- Power verification measurement
- Area scan
- 7x7x7 cube (zoom) scan
- Robot movement to maximum location
- Z-axis scan
- Power verification re-test (Drift)

8. Measurement Uncertainty

The possible errors included in this measurement arise from device positioning uncertainty, device manufacturing uncertainty, liquid dielectric permittivity uncertainty, liquid dielectric conductivity uncertainty, and uncertainty due to disturbance of the fields by the probe.

9.3 RF Power Measurement Procedure

9.3.1 Test Setup

Connect the transmitter output to communications test set as shown in Figure 9-1 and configure the EUT to operate at maximum power in a call per procedures defined in sections 9.4 . Measure the conducted transmit power at the frequencies defined in 9.1 .

Power measurements are completed using a power meter configured to measure average power. The cable loss must be measured for the specific frequencies under test and added as a correction factor for all the tests.

9.4 Base Station Emulator Settings and Test Procedures

9.4.1 For CDMA2000 1x/EVDO

Use CDMA2000 Rev 6 protocol in the call box.

- 1) Test for Reverse/Forward TCH RC1, Reverse/Forward TCH RC2, and RC3 Reverse FCH and demodulation of RC 3, 4 or 5.
 - a. Set up a call using Fundamental Channel Test Mode 1 (RC1, SO 2) with 9600 bps data rate only.
 - b. As per C.S0011 or TIA/EIA-98-F Table 4.4.5.2-1, set the test parameters as shown in Table 9-3.
 - c. Send continuously '0' power control bits to the Gobi2000 module.
 - d. Measure the output power at Gobi2000 module's antenna connector as recorded on the power meter with values corrected for cables losses.
 - e. Repeat step b through d for Fundamental Channel Test Mode:
 - i. RC1, SO55
 - ii. RC2, SO9
 - iii. RC2, SO55
 - iv. RC3, SO55
- 2) Test for RC 3 Reverse FCH, RC3 Reverse SCH0 and demodulation of RC 3, 4 or 5.
 - a. Set up a call using Supplemental Channel Test Mode 3 (RC 3, SO 32) with 9600 bps Fundamental Channel and 9600 bps SCH0 data rate.
 - b. As per C.S0011 or TIA/EIA-98-F Table 4.4.5.2-2, set the test parameters as shown in Table 9-4.
 - c. Send alternating '0' and '1' power control bits to the Gobi2000 module.
 - d. Determine the active channel configuration. If the desired channel configuration is not the active channel configuration, increase \hat{I}_0 by 1 dB and repeat the verification. Repeat this step until the desired channel configuration becomes active.
 - e. Measure the output power at the Gobi2000 module antenna connector.
 - f. Decrease \hat{I}_0 by 0.5 dB.
 - g. Determine the active channel configuration. If the active channel configuration is the desired channel configuration, measure the output power at the Gobi2000 module's antenna connector.

- h. Repeat step f and g until the output power no longer increases or the desired channel configuration is no longer active. Record the highest output power achieved with the desired channel configuration active.
 - i. Repeat step a through h ten times and average the result.
- 3) Test for RC3 Reverse FCH, RC 3 DCCH and demodulation of RC3, 4 or 5.
- a. Use the same procedure as described in 2).

Table 9-3 Parameters for Max. Power with a single traffic code channel, SR1

Parameter	Units	Value
\hat{I}_{or}	dBm/1.23 MHz	-104
$\frac{\text{Pilot } E_c}{I_{or}}$	dB	-7
$\frac{\text{Traffic } E_c}{I_{or}}$	dB	-7.4

$\frac{\text{Traffic } E_c}{I_{or}}$	dB	-7.4

1xEV-DO

- 1) Use 1xEV-DO Rel 0 protocol in the call box.
 - a. RTAP
 - Select Test Application Protocol to RTAP
 - Set RTAP Rate to 9.6 kbps
 - Generator Info -> Termination Parameters -> Max Forward Packet Duration -> 16 Slots
 - Set \hat{I}_{or} to -60 dBm/1.23 MHz
 - Send continuously '0' power control bits
 - Measure the power at Gobi2000 antenna connector
 - Repeat above steps for RTAP Rate = 19.2 kbps, 38.4 kbps, 76.8 kbps and 153.6 kbps respectively
- 2) Use 1xEV-DO Rev A protocol in the call box.
 - a. RETAP
 - Select Test Application Protocol to RETAP
 - F-Traffic Format -> 4 (1024, 2, 128) Canonical (307.2k, QPSK)
 - Set R-Data Pkt Size to 128
 - Protocol Subtype Config -> Release A Physical Layer Subtype -> Subtype 2 -> PL Subtype 2 Access Channel MAC Subtype -> Default (Subtype 0)
 - Generator Info -> Termination Parameters -> Max Forward Packet Duration -> 16 Slots -> ACK R-Data After -> Subpacket 0 (All ACK)
 - Set \hat{I}_{or} to -60 dBm/1.23 MHz

- Send continuously '0' power control bits
- Measure the power at GOBI2000 module antenna connector
- Repeat above steps for R-Data Pkt Size = 256, 512, 768, 1024, 1536, 2048, 3072, 4096, 6144, 8192, 12288 respectively.
- Repeat above steps for R-Data Pkt Size = 256, 512, 768, 1024, 1536, 2048, 3072, 4096, 6144, 8192, 12288 respectively.

9.4.2 For WCDMA/HSDPA/HSUPA

Configure the call box to support all WCDMA tests in respect to the 3GPP 34.121 (listed in Table 9-5).
Rel99

- 1) Set a Test Mode 1 loop back with a 12.2kbps Reference Measurement Channel (RMC)
- 2) Set and send continuously Up power control commands to the Gobi 2000 module.

HSDPA Rel 6

- 1) Establish a Test Mode 1 loop back with both 1 12.2kbps RMC channel and a H-Set1 Fixed Reference Channel (FRC). With the 8820 this is accomplished by setting the signal Channel Coding to "Fixed Reference Channel" and configuring for HSET-1 QKSP.
- 2) Set beta values and HSDPA settings for HSDPA Subtest1 according to Table 9-5
- 3) Send continuously Up power control commands to the Gobi2000 module
- 4) Measure the power at the Gobi2000 module's antenna connector using the power meter with modulated average detector
- 5) Repeat the measurement for the HSDPA Subtest2, 3 and 4 as given in Table 9-5

HSUPA Rel 6

- 1) Use UL RMC 12.2kbps and FRC H-Set1 QPSK, Test Mode 1 loop back. With the 8820 this is accomplished by setting the signal Channel Coding to "E-DCH Test Channel" and configuring the equipment category to Cat6_10ms.
- 2) Set the Absolute Grant for HSUPA Subtest1 according to Table 9-5
- 3) Set the Gobi2000 module power to be at least 5dB lower than the Maximum output power
- 4) Send power control bits to give one TPC_cmd = +1 command to the Gobi2000 module. If the Gobi2000 module doesn't send any E-DPCH data with decreased E-TFCI within 500ms, then repeat this process until the decreased E-TFCI is reported.
- 5) Confirm that the E-TFCI transmitted by the Gobi2000 module is equal to the target E-TFCI in Table 9-5. If the E-TFCI transmitted by the Gobi2000 module is not equal to the target E-TFCI, then send power control bits to give one TPC_cmd = -1 command to the UE. If UE sends any E-DPCH data with decreased E-TFCI within 500 ms, send new power control bits to give one TPC_cmd = -1 command to the UE. Then confirm that the E-TFCI transmitted by the UE is equal to the target E-TFCI in Table 9-5. If the E-TFCI transmitted by the UE is not equal to the target E-TFCI, then fail the UE
- 6) Repeat the measurement for the HSUPA Subtest2, 3, 4 and 5 as given in Table 9-5

9.4.3 For GSM/GPRS/EGDE

- Configure the call box to support GPRS test.
- Configure for desired number of uplink transmit lots.
- Set MS_TX level to 0 (850 MHz) or 2 (1900MHz) to configure EUT to transmit at maximum output power.
