— CHAPTER 3
TECHNICAL THEORY

1. GENERAL

THE KOREA KDK SH-780 NUMERIC DISPLAY PAGER IS A DOUBLE SUPERHETERODYNE FM RECEIVER WHICH USES DIGITAL SIGNALING SYSTEM FOR CALLING.
IT IS POWERED BY A " AAA " TYPE 1.5V BATTERY.

2. BLOCK DIAGRAM DESCRITION

THE CHAPTER 5 RECEIVER BOARD BLOCK DIAGRAM GIVES THE FUNCTION BLOCK DIAGRAM OF THE RECEIVER BOARD AND CHAPTER 5 DIGITAL BOARD BLOCK DIAGRAM GIVES THE FUNCTIONAL BLOCK DIAGRAM OF DIGITAL BOARD.

3. CIRCUIT DESCRIPTION

* RECEIVER BOARD

ANT

THE PAGER USES A METAL LOOP ANTENNA BUILT IN THE PAGER.
THIS ANTENNA PICK UP THE DESIGNATED SIGNALS AND CONNECTS THEM TO THE RF AMP. TUNING WITH THE FREQUENCY IS DETERMINED BY THE ANT TUNING CAPACITOR (CT1) CAPACITY.

RF AMP

THE SIGNALS RECEIVED BY THE LOOP ANTENNA ARE INPUT TO THE AMPLIFICATION CIRCUIT FORMED BY TWO TRANSISTORS.
THIS AMPLIFIER IS A LOW NOISE HIGH GAIN AMPLIFIER.

BPF1

THE EXTRANEOUS SIGNALS SUCH AS IMAGE AND SPURIOUS SIGNALS IN THE SIGNALS AMPLIFIED BY THE RF AMP ARE ATTENUATED BY PROXIMATELY 60 dB BY LC FILTER WITH LOW INSERTION LOSS CHARACTERISTICS.
IN ADDITIONS, EXTRANEOUS RADIATION FROM THE UNIT IS SUPPRESSED.

LOCAL OSC 1

IN THE LOCAL OSCILLATOR CIRCUIT A 3RD OVERTONE CRYSTAL IS OSCILLATED BY A COLPITTS CIRCUIT, AND THE TARGET FREQUENCY IS FILTERED BY BAND PASS FILTER.
THE CALCULATION METHOD IS AS FOLLOWS.

FL = FR - 21.4 [MHz]
WHERE FL : LOCAL FREQUENCY
FR : RECEIVING CARRIER FREQUENCY

MIXER 1

THE RF SIGNAL (RECEIVED SIGNALS) WHICH HAS PASSED THROUGH THE BPF 1 AND THE LOCAL OSCILLATOR SIGNAL ARE INPUT TO THE MIXER CIRCUIT AND CONVERTED TO 21.4 MHz (IF) REGARDLESS OF THE VALUE OF THE RECEIVING CARRIER FREQUENCY.

IF AMP

THE RECEIVED SIGNAL CONVERTED TO THE 1ST INTERMEDIATE FREQUENCY IS AMPLIFIED BY THE TRANSISTOR AMPLIFIER CIRCUIT.

BPF 2

BPF 2 IS A NARROW BAND X-TAL FILTER (APPROXIMATELY 21.4MHz).
ITS MAJOR FUNCTION IS TO ATTENUTE THE ADJACENT CHANNEL SIGNALS AND ASSURE SELECTIVITY CHARACTERISTICS.

LOCAL OSC 2

THE TARGET FREQUENCY OF LOCAL OSC 2 IS AS FOLLOWS.

FL2=21.4 - 0.455 [MHz] = 20.945 MHz
WHERE FL2 : 2ND LOCAL FREQUENCY

IF STAGE

THE IF SIGNAL AND 2ND LOCAL OSCILLATOR SIGNAL ARE INPUT TO THE 2ND MIXER CIRCUIT AND CONVERTED TO 455 KHz BY INTERNAL MIXER AND AMPLIFIED BY 455 KHz AMPLIFIER.
THE LIM/DISC (FREQUENCY LIMMITTER AND DISCRIMINATOR) USING QUADRATURE DETECTION IS USED TO CONVERT THE FREQUENCY DEVIATION QUANTITY INTO VOLTAGE CHANGE FOR DEMODULATION.
THE BASE BAND SIGNAL (SINE WAVE) IS COMPARED TO THE REFERENCE VOLTAGE WHICH IS THE INTEGRAL VALUE OF THE RECEIVED DATA IN ORDER TO CONVERT IT INTO A BINARY DIGITAL SIGNAL (SQUARE WAVE)

* DIGITAL BOARD

DECODER

THE FOLLOWING PROCESSES ARE PERFORMED BY DECODER. (U3)
(1) SELECTION INFORMATION AND JUDGEMENT FUNCTION OF 512 1200 2400BPS.
(2) BATTERY SAVING FUNCTION.
(3) FUNCTION ADJUSTMENT OF BIT RATE ERROR.
(4) SEARCHING ERROR AND MAKING CORRECTION (2 BIT).

CPU

THE FOLLOWING PROCESSES ARE PERFORMED BY CPU. (U1)
(1) STORAGE AND MANAGEMENT OF THE RECEIVED INFORMATION.
(2) LCD DRIVING AND ILLUMINATION CONTROL.
(3) LOW BATTERY ALERT CONTROL.
(4) DECODER CONTROL.
(5) CLOCK FUNCTION.

EEPROM

THIS EEPROM (U2) STORES THE FOLLOWING DATA :

(1) 4 ADDRESS.

(2) 10 LOCKED INFORMATION.

(3) SELECT MELODY.

(4) DECODER INITIAL DATA.

DC-DC CONVERTER

AS THE DIGITAL PART WHICH MANAGE THE RECEIVED INFORMATION DRIVES IN 3.0 VOLT, WE USED VOLTAGE REGULATOR (U4) THAT CAN EARN 3.0 [V] OUT-PUT BY IN-PUTTING 1.05 [V] ~ 1.7 [V].

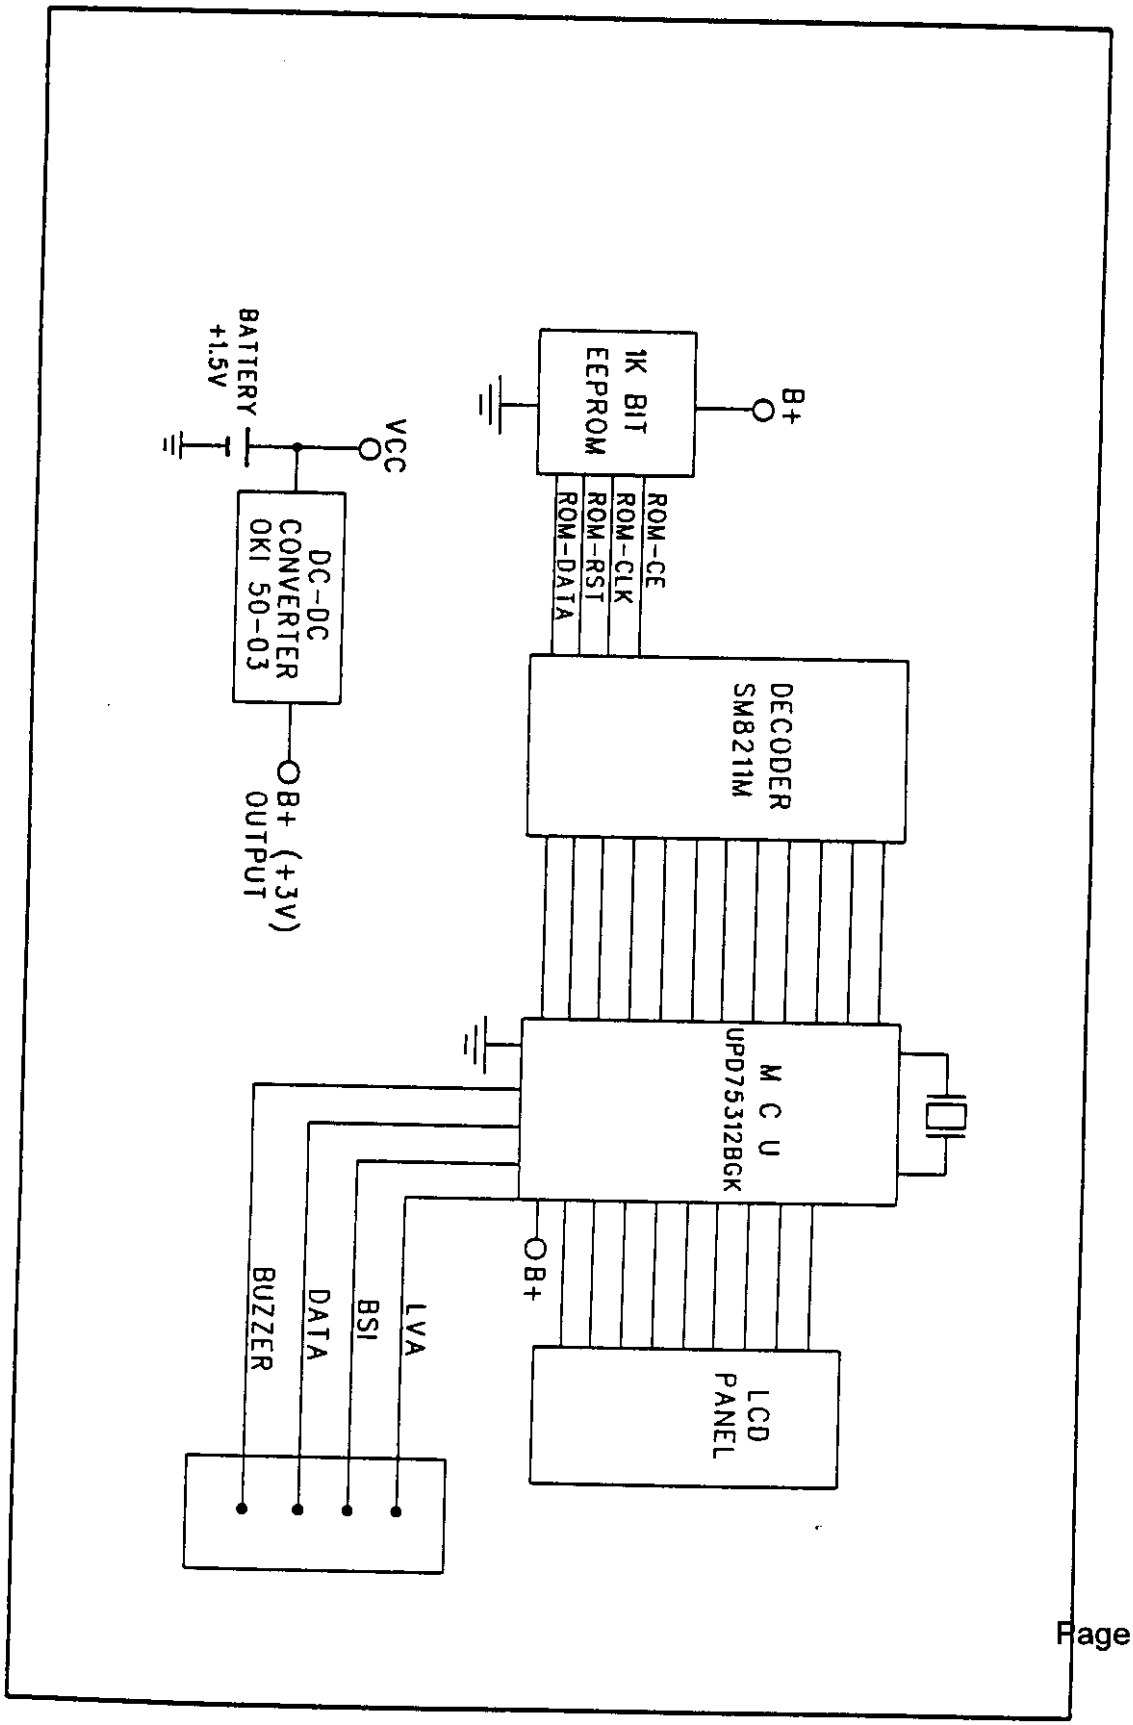
2) DIGITAL PART



TEST: **FIELD STRENGTH OF RADIATED EMISSIONS**

Grantee: Shinwa Communications of America, Inc.

FCC ID: JCA-SH780B Model: SH780B

Setup:

The equipment under test (EUT) was configured and operated in accordance with the applicable provisions of ANSI C63.4-1992, Section 6, 12. Measurements were made in accordance with applicable paragraphs of Section 8.2.3, Section 12.1.1.1 Appendix D, Section 12.1.4 and Appendix H3 and H4.

The EUT was placed on a 1 by 1.5 meter table located 40 cm above a 2 meter diameter non-metallic turntable that sits 40 cm above the 15 X 30 meter ground plane at Spectrum's Open Area Test Site. The bi-conical or log-periodic antenna was mounted on a tower spaced at a three meters distance, and arranged for adjustment in height (1-4 meters) and vertical/horizontal polarization to maximize the emissions levels when combined with turntable rotation of the EUT. The dual ridged guide antenna was mounted on a tripod at one meter height and adjusted for vertical or horizontal antenna orientation. An HP 8562A spectrum analyzer with an HP 8447F, Option H64 amplifier and an HP 83006A pre-amplifier were used for the peak measuring instrumentation.

Discussion:

The EUT is a VHF-FM Numeric superheterodyne Paging receiver. The receiver was powered with a single new AAA 1.5 Volt battery during measurements.

One set of measurements was made for each of the two sample receivers tested covering the 8.0 MHz wide frequency band of operation from 159-167 MHz. One sample was operating on a low channel, 159.500 MHz and the other on a high channel, 166.500 MHz.

Preliminary measurements were made as described in Section 8.3.11 and 12.1.4.1 with the receiver operating as described. The receiver was observed while positioned in three mutually orthogonal planes during which it appeared that the horizontal position, with the display facing upward, as the "worst case" position.

During preliminary measurements only a few emissions were detected. However, only with the use of an amplifier and when the receive antenna was placed in immediate proximity of the EUT. Using an HPamplifier and moving in to less than 50 cm EUT to antenna distance for frequencies from 1 to 2 GHz, no harmonics were observed.

The EUT placement on the table is detailed in the photograph included with this report.

The final set of measurements as detailed in Section 8.3.1.2 and 12.1.4.2 were made as specified. RBW and VBW of 100 kHz was used for measurements below 1 GHz. Above 1 GHz peak measurements were made with a RBW and VBW of 1 MHz. The pager position used was based on the preliminary measurements with the display side facing up and the back or FCC ID lable side facing down. We also endeavored to maximize emission levels of the EUT as approipriate, with rotation of the table and adjustment of antenna height and polarization.

Measurements were made over the frequency range of 30 - 2000 MHz in accordance with Section 15.33. No emissions were measurable at three meters during the final detailed radiated emissions measurements for either sample tested. An HP 8447F pre-amplifier was used during the measurements.

FCC Part 15.109(b) Field Strength of Radiated Spurious Emissions
Final Data

Grantee: Shinwa Communications of America, Inc.

1/13/99

FCC ID: JCA-SH780B

Radiated Emissions Measurements By Frequency

Freq MHz	Vert dBm	Horz dBm	Ant-F	dBuV/m	uV/m	dB +/- Limit	Limit uV/m @ 3 Meters

No measurable emissions at three meters

No receiver antenna conducted emissions measurements were made for the EUT. The antenna is a permanently attached loop antenna so we were unable to connect the spectrum analyzer to the receiver to recorded the antenna conducted spurious emissions.

Conclusion:

The Shinwa Communications of America, Inc., FCC ID: JCA-SH780B, when operated and measured as discussed above, meets the receiver radiated spurious emissions requirements under Title 47, CFR Part 15.109(a). **This receiver is not subject to the transition provisions of Part 15.37.**
