RE: Rokonet Electronics Ltd.

FCC ID: JE4RWT30S433

After a review of the submitted information, I have a few comments on the above referenced Application.

- 1) All the different modes are confusing. To clarify, it would be suggested to update the operational description to describe all modes of duty factors in one document (i.e. alarm modes, installation test modes, etc.) and how the various shut off requirements and duty factors are met for each and also kindly label which are only for installation vs. those for normal use.
- 2) Please explain transmissions from utilization of the test button. Information in a users manual supplement suggests > 5 second transmission due to professional installers utilization. In addition, please see the attached information regarding the rules changes involved with this. Given the information in this docket, it is assumed that the device should be complex enough that transmission > 5 seconds are necessary. Additionally the design of the device does not appear to keep the general user from being able to utilize this feature and therefore limit it to the installer. Due to these concerns we have a pending inquiry with the FCC to help clarify acceptable conditions for allowing transmission for professional installers which are > 5 sec but < 10 seconds. Note that currently uncertain if this device can be allowed > 5 seconds for certain installation transmissions. We will provide further information as we receive it.
- 3) For the occupied bandwidth test, generally the RBW should be > 1% of the bandwidth. However ANSI C63.4 also specifies a minimum bandwidth to use as well (see section 13.1.7). The minimum RBW for this should be set to 10 kHz.
