FCC Part22/24/27 Rev.01

5.4 Band Edge

5.4.1 Description of Conducted Band Edge Measurement

22.917(a) for Band5.

For operations in the 824-849MHz band, the FCC limit is $43+10\log_{10}(P[\text{Watts}])$ dB below the transmitter power $P(\text{Watts})$ in a 100kHz bandwidth. However, in the 1MHz bands immediately outside and adjacent to the licensee's frequency block, a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed.

24.238(a) for Band2, 25

For operations in the 1850-1910MHz band and 1930-1990MHz, the FCC limit is $43+10\log_{10}(P[\text{Watts}])$ dB below the transmitter power $P(\text{Watts})$ in a 1MHz bandwidth. However, in the 1MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed.

27.53(g) for Band12, 17

For operations in the 698-746MHz band, the FCC limit is $43+10\log(P[\text{Watts}])$ dB below the transmitter power $P(\text{Watts})$ in a 100kHz bandwidth. However, in the 100kHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least 30kHz may be employed.

27.53 (h) for Band4

For operations in the 1710-1755MHz band, the FCC limit is $43+10\log(P[\text{Watts}])$ dB below the transmitter power $P(\text{Watts})$ in a 1MHz bandwidth. However, in the 1MHz bands immediately outside and adjacent to the licensee's frequency block, a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed.

27.53 (m)(4) for FCC Band7, 41

For mobile digital stations, the attenuation factor shall be not less than $40+10\log(P)$ dB on all frequencies between the channel edge and 5 MHz from the channel edge, $43+10\log(P)$ dB on all frequencies between 5MHz and X MHz from the channel edge, and $55+10\log(P)$ dB on all frequencies more than X MHz from the channel edge, where X is the greater of 6MHz or the actual emission bandwidth as defined in paragraph (m)(6) of this section. In addition, the attenuation factor shall not be less than $43+\log(P)$ dB on all frequencies between 2490.5MHz and 2496MHz and $55+\log(P)$ dB at or below 2490.5MHz. Mobile Satellite Service licensees operating on frequencies below 2495 MHz may also submit a documented interference complaint against BRS licensees operating on channel BRS Channel 1 on the same terms and conditions as adjacent channel BRS or EBS licensees.

5.4.2 Test Instruments

The measuring equipment is listed in the section 4.1 of this test report.

5.4.3 Test Procedure

- a. The EUT was connected to the spectrum analyzer and system simulator via a power divider.
- b. The band edges of low and high channels for the highest RF powers were measured.
- c. Set RBW $\geq$ 1% EBW in the 1MHz band immediately outside and adjacent to the band edge.
- d. Beyond the 1 MHz band from the band edge, RBW=1MHz was used or a narrower RBW was used and the measured power was integrated over the full required measurement bandwidth of 1 MHz.
- e. Set spectrum analyzer with RMS detector.
- f. The RF fundamental frequency should be excluded against the limit line in the operating frequency band.
- g. Checked that all the results comply with the emission limit line.

Example:

The limit line is derived from $43 + 10\log(P)$ dB below the transmitter power P(Watts)

$$= P(W) - [43 + 10\log(P)](dB)$$

$$= [30 + 10\log(P)](dBm) - [43 + 10\log(P)](dB) = -13dBm.$$

- h. For LTE Band7, the other 40 dB, and 55 dB have additionally applied same calculation above. The limit line is derived from $40 + 10\log(P)$ dB below the transmitter power P(Watts)

$$= P(W) - [40 + 10\log(P)](dB)$$

$$= [30 + 10\log(P)](dBm) - [40 + 10\log(P)](dB)$$

$$= -10dBm$$

The limit line is derived from $55 + 10\log(P)$ dB below the transmitter power P(Watts)

$$= P(W) - [55 + 10\log(P)](dB)$$

$$= [30 + 10\log(P)](dBm) - [55 + 10\log(P)](dB)$$

$$= -13dBm$$

The limit line is derived from $55 + 10\log(P)$ dB below the transmitter power P(Watts)

$$= P(W) - [55 + 10\log(P)](dB)$$

$$= [30 + 10\log(P)](dBm) - [55 + 10\log(P)](dB)$$

$$= -25dBm$$

5.5 Conducted Spurious Emissions

5.5.1 Description of Conducted Spurious Emission Measurement

The power of any emission outside of the authorized operating frequency ranges must be lower than the transmitter power(P) by a factor of at least $43+10\log(P)$ dB.

For band7, 41:

The power of any emission outside of the authorized operating frequency ranges must be lower than the transmitter power(P) by a factor of at least $55+10\log(P)$ dB.

It is measured by means of a calibrated spectrum analyzer and scanned from 30 MHz up to a frequency including its 10th harmonic.

5.5.2 Test Instruments

The measuring equipment is listed in the section 4.1 of this test report.

5.5.3 Test Procedure

- a. The EUT was connected to the spectrum analyzer and system simulator via a power divider.
- b. The RF output of the EUT was connected to the spectrum analyzer by RF cable and attenuator. The path loss was compensated to the results for each measurement.
- c. The middle channel for the highest RF power within the transmitting frequency was measured.
- d. The conducted spurious emission for the whole frequency range was taken.
- e. Make the measurement with the spectrum analyzer's RBW=1MHz, VBW=3MHz.
- f. Set spectrum analyzer with RMS detector.
- g. Taking the record of maximum spurious emission.
- i. The RF fundamental frequency should be excluded against the limit line in the operating frequency band.
- j. The limit line is derived from $43+10\log(P)$ dB below the transmitter power P(Watts).

$$=P(W)-[43+10\log(P)](dB)$$

$$=[30+10\log(P)](dBm)-[43+10\log(P)](dB)$$

$$=-13dBm.$$

For Band7, 41

The limit line is derived from $55+10\log(P)$ dB below the transmitter power P(Watts).

$$=P(W)-[55+10\log(P)](dB)$$

$$=[30+10\log(P)](dBm)-[55+10\log(P)](dB)$$

$$=-25dBm.$$

5.6 Frequency Stability

5.6.1 Description of Frequency Stability Measurement

The frequency stability shall be measured by variation of ambient temperature and variation of primary supply voltage to ensure that the fundamental emission stays within the authorized frequency block. The frequency stability of the transmitter shall be maintained within $\pm 0.00025\%$ ($\pm 2.5\text{ppm}$) of the center frequency.

5.6.2 Test Instruments

The measuring equipment is listed in the section 4.1 of this test report.

5.6.3 Test Procedure for Temperature Variation

- a. The EUT was set up in the thermal chamber and connected with the system simulator.
- b. With power OFF, the temperature was decreased to -20°C and the EUT was stabilized before testing. Power was applied and the maximum change in frequency was recorded within one minute.
- c. With power OFF, the temperature was raised in 10°C steps up to 60°C . The EUT was stabilized at each step for at least half an hour. Power was applied and the maximum frequency change was recorded within one minute.

5.6.4 Test Procedure for Voltage Variation

- a. The EUT was placed in a temperature chamber at $25\pm 5^{\circ}\text{C}$ and connected with the system simulator.
- b. The power supply voltage to the EUT was varied from 3.42V to 4.18V of the nominal value measured at the input to the EUT.
- c. The variation in frequency was measured for the worst case.

5.7 Effective Radiated Power/Equivalent Isotropic Radiated Power

5.7.1 Description of ERP/EIRP Measurement

Mobile and portable (hand-held) stations operating are limited to average ERP of 7 watts with LTE band 5 and 3 watts with LTE band 12/17.

Mobile and portable (hand-held) stations operating are limited to average EIRP of 2 watts with LTE band 2/25/7 and 1 watt with LTE band 4.

5.7.2 Test Instruments

The measuring equipment is listed in the section 4.1 of this test report.

5.7.3 Test Procedures

Effective Isotropic Radiated Power (EIPR) was calculated with the correction factor, $EIPR = \text{Conducted Output Power} + \text{Substitution antenna gain}$. $ERP = EIPR - 2.15$.

5.7.4 Test Result

5.8 Radiated Spurious Emission

5.8.1 Description of Radiated Spurious Emission

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitter power (P) by a factor of at least $43 + 10 \log (P)$ dB.

For Band 7, 41

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitter power (P) by a factor of at least $55 + 10 \log (P)$ dB.

For operations in the 746-758 MHz, 775-788 MHz, and 805-806 MHz bands, emission in the band 1559-1610 MHz shall be limited to -70 dBW/MHz equivalent isotropically radiated power (EIRP) for wideband signals, and -80 dBW EIRP for discrete emissions of less than 700 Hz bandwidth.

The spectrum is scanned from 30 MHz up to a frequency including its 10th harmonic.

5.8.2 Test Instruments

The measuring equipment is listed in the section 4.1 of this test report.

5.8.3 Test Procedures

- a. The EUT was placed on a rotatable wooden table with 0.8 meter above ground.
- b. The EUT was set 3 meters from the receiving antenna, which was mounted on the antenna tower.
- c. The table was rotated 360 degrees to determine the position of the highest spurious emission.
- d. The height of the receiving antenna is varied between one meter and four meters to search the maximum spurious emission for both horizontal and vertical polarizations.
- e. Make the measurement with the spectrum analyzers RBW = 1MHz, VBW = 3MHz, taking the record of maximum spurious emission.
- f. A horn antenna was substituted in place of the EUT and was driven by a signal generator.
- g. Tune the output power of signal generator to the same emission level with EUT

maximum spurious emission.

- h. Taking the record of output power at antenna port.
- i. Repeat step f to step g for another polarization.
- j. The RF fundamental frequency should be excluded against the limit line in the operating frequency band.

The limit line is derived from $43 + 10 \log(P)$ dB below the transmitter power P(Watts)

$$= P(W) - [43 + 10 \log(P)](dB)$$

$$= [30 + 10 \log(P)](dBm) - [43 + 10 \log(P)](dB)$$

$$= -13dBm.$$

For Band7, 38, 41

The limit line is derived from $55 + 10 \log(P)$ dB below the transmitter power P(Watts).

$$= P(W) - [55 + 10 \log(P)](dB)$$

$$= [30 + 10 \log(P)](dBm) - [55 + 10 \log(P)](dB)$$

$$= -25dBm.$$

- k. EIRP (dBm) = S.G.Power – Tx Cable Loss + Tx Antenna Gain.
- l. ERP (dBm) = EIRP-2.15.

5.8.4 Test Setup

For radiated emissions from 30MHz to 1GHz

For radiated emissions above 1GHz

5.8.5 Test Result

Spurious emissions below 1GHz were found more than 20dB below limit line

LTE Band 2 (BW=1.4MHz, position 1)

Frequency	MaxPeak	Limit	Margin	SG	Cable loss	Gain	Read	Height	Pol	Azimuth

7 APPENDIX - INFORMATION ON THE TESTING LABORATORIES

We, BYD Precise Manufacture Co., Ltd., were founded in 2007 to provide our best service in RF, Radio consultation. Our laboratories are accredited by the following accreditation bodies according to ISO/IEC 17025 (2005) .

USA

A2LA

Certificate No.: 4886.01

Copies of accreditation certificates could be inquired from our office. If you have any comments, please feel free to contact us at the following:

EMC / RF / Lab:

Tel: +86-755 8489 8888 55501

Fax: +86-755 8964 3771
