# TEST - REPORT

FCC RULES PARTS 22H and 24E  
IC RADIO STANDARDS RSS 132 and RSS 133

FCC ID: JYCA100

Model Name: A100

Test report no.: G5M206110086-P-2224

Certificate 1983.01

## TABLE OF CONTENTS

### **1 General information**

- 1.1 Notes
- 1.2 Testing laboratory
- 1.3 Details of approval holder
- 1.4 Application details
- 1.5 Test item
- 1.6 Test standards

### **2 Technical test**

- 2.1 Summary of test results
- 2.2 Test environment
- 2.3 Test equipment utilized
- 2.4 General test procedure
- 2.5 Test results

### **3 Transmitter parameters**

- 3.1 RF power output conducted
- 3.2 RF power output radiated (ERP, EIRP)
- 3.3 Occupied bandwidth, emission bandwidth
- 3.4 Frequency stability
- 3.5 Spurious emission conducted (antenna terminal)
- 3.6 Spurious emission radiated
- 3.7 Block edge compliance
- 3.8 AC power line conducted emission

### **4 Receiver parameters**

- 4.1 Radiated emission

## APPENDIX

# 1 General information

## 1.1 Notes

The purpose of conformity testing is to increase the probability of adherence to the essential requirements or conformity specifications, as appropriate.

The complexity of the technical specifications, however, means that full and thorough testing is impractical for both technical and economic reasons.

Furthermore, there is no guarantee that a test sample which has passed all the relevant tests conforms to a specification.

Neither is there any guarantee that such a test sample will interwork with other genuinely open systems.

The existence of the tests nevertheless provides the confidence that the test sample possesses the qualities as maintained and that its performance generally conforms to representative cases of communications equipment.

The test results of this test report relate exclusively to the item tested as specified in 1.5.

The test report may only be reproduced or published in full.

Reproduction or publication of extracts from the report requires the prior written approval of the ETS PRODUCT SERVICE AG.

## 1.2 Testing laboratory

### 1.2.1 Location

ETS PRODUCT SERVICE AG  
Storkower Strasse 38c  
D-15526 Reichenwalde b. Berlin  
Germany  
Telephone : +49 33631 888 00  
Telefax : +49 33631 888 660

### 1.2.2 Details of accreditation status

**ACCREDITED TESTING LABORATORY**  
DAR-REGISTRATION NUMBER: DAT-P-201/96

**ACCREDITED COMPETENT BODY**  
BNETZA-REGISTRATION NUMBER: BNETZA-zS-026/96

**FCC FILED TEST LABORATORY:**  
REG. No. 96970

**INDUSTRY CANADA FILED TEST LABORATORY**  
REG. No. IC 3470

**A2LA ACCREDITED**  
CERTIFICATE NUMBER: 1983.01

**BLUETOOTH QUALIFICATION TEST FACILITY (BQTF)**  
ACCREDITED BY: BLUETOOTH QUALIFICATION REVIEW BOARD (BQRF)

## 1.3 Details of approval holder

|           |  |
|-----------|--|
| Name      | : Pantech Co., Ltd.                          |
| Street    | : Shinsong Center Bldg., 25-12, Yeouido-dong |
| Town      | : 150-711 Yeoungdeungpo-gu, Seoul            |
| Country   | : Korea                                      |
| Telephone | : +82-2-3660-5862                            |
| Fax       | : +82-2-3660-5990                            |
| Contact   | : Mr. B.W. Kim                               |
| E-Mail    | : +82-2-3660-5862                            |

## 1.4 Application details

Date of receipt of application : 29.11.2006  
Date of receipt of test item : 29.11.2006  
Date of test : 08.12.2006

## 1.5 Test item

Description of test item : Triple Band GSM 850 /DCS 1800 /PCS 1900 (with WAP & GPRS)  
Type identification : A100  
Serial number : without serial number  
Photos : See annex A.

### Technical data

Frequency range Tx - GSM 850 : 824.2 - 848.80 MHz  
Frequency range Tx - PCS : 1850.2 - 1909.8 MHz  
Frequency range Rx - GSM 850 : 869.2 - 893.8 MHz  
Frequency range Rx - PCS : 1930.2 - 1989.8 MHz  
Antenna Type : internal antenna  
Antenna Gain : GSM 850 -2.9 dBi (manufacturer declaration)  
PCS 1900 -2 dBi (manufacturer declaration)  
Power supply : 4.2 V DC  
Operating mode : duplex  
Type of modulation : GMSK (GSM modulation)  
Emission : GXW

### Manufacturer: (if applicable)

Name :  
Street :  
Town :  
Country :

## 1.6 Test standards

- Technical standard : FCC Parts: 22H, 24E, 2, 15  
 IC Standards: RSS 132, RSS 133
- Additional information : Because of using the GSM 850 as an alternative technology in 850 MHz band, not all test cases of FCC Part 22 are required.  
 This device contains 1800 MHz not operational in U.S. Territories. This filing is only applicable for 850/1900 MHz operations.

## 2 Technical test

### 2.1 Summary of test results

No deviations from the technical specification(s) were ascertained in the course of the tests performed.

or

The deviations as specified in 2.5 were ascertained in the course of the tests performed.

### 2.2 Test environment

- Temperature : 25 °C
- Relative humidity content : 20 ... 75 %
- Air pressure : 86 ... 103 kPa

### 2.3 Test equipment utilized

| No.      | Test equipment                 | Type                  | Manufacturer       |
|----------|--------------------------------|-----------------------|--------------------|
| ETS 0001 | ESD Gun                        | SESD 30000            | Schlöder           |
| ETS 0002 | Test receiver                  | ESVP                  | R & S              |
| ETS 0003 | Diode Power Sensor             | NRV-Z2                | R & S              |
| ETS 0004 | Spektrum- and Network-Analyzer | FSMS 26               | R & S              |
| ETS 0005 | RF amplifier matrix            | RSU-ETS-CTR6          | ETS                |
| ETS 0006 | HP-Filter                      | H1G04G01              | Microwave          |
| ETS 0007 | Horn antenna                   | AT 4004               | ar                 |
| ETS 0008 | Antenna                        | Loop antenna          | Siemens            |
| ETS 0009 | Comb Generator Emitter         | CGE 02                | York EMC Services  |
| ETS 0011 | Antenna (van Veen/Frame)       | HM020Z3               | R & S              |
| ETS 0012 | Biconical Antenna              | HK 116                | R & S              |
| ETS 0013 | LPD Antenna                    | HL 223                | R & S              |
| ETS 0014 | Log Periodical Antenna         | HL 025                | R & S              |
| ETS 0015 | Log Periodical Antenna         | HL 025                | R & S              |
| ETS 0016 | Precision antenna kit          | VHAP                  | Schwarzbeck        |
| ETS 0017 | Precision antenna kit          | UHAP                  | Schwarzbeck        |

## 2.4 General test procedure

**POWER LINE CONDUCTED INTERFERENCE:** The procedure used was ANSI STANDARD C63.4-2003 5.2 using a 50  $\mu$ H LISN (if necessary). Both lines were observed. The bandwidth of the spectrum analyzer was 10 kHz with an appropriate sweep speed.

**RADIATION INTERFERENCE:** The test procedure used was ANSI STANDARD C63.4-2003 6.4 using a spectrum analyzer. The resolution bandwidth of the spectrum analyzer was 100 kHz for measurements below 1 GHz and RBW 1 MHz was used above 1 GHz. The analyzer was calibrated in dB above a microvolt at the output of the antenna.

**FORMULA OF CONVERSION FACTORS for Field strength:** The Field Strength at 3 m was established by adding the meter reading of the spectrum analyzer (which is set to read in units of dB $\mu$ V) to the antenna correction factor supplied by the antenna manufacturer. The antenna correction factors are stated in terms of dB.

Example:

Freq. (MHz)      METER READING + ACF + CABLE LOSS (to the receiver) = FS  
33                      20 dB $\mu$ V + 10.36 dB + 6 dB = 36.36 dB $\mu$ V/m @ 3 m

**ANSI STANDARD C63.4-2003 6.2.1 MEASUREMENT PROCEDURES:** The UUT was placed on a table 80 cm high and with dimensions of 1 m by 1.5 m (non metallic table). The UUT was placed in the center of the table. The table used for radiated measurements is capable of continuous rotation. The spectrum was scanned from 30 MHz to at least 10<sup>th</sup> harmonic of the fundamental.

Peak readings were taken in three (3) orthogonal planes and the highest readings.

Measurements were made by ETS Product Service AG at the registered open field test site located at Storkower Str. 38c, 15526 Reichenwalde, Germany.

When an emission was found, the table was rotated to produce the maximum signal strength. At this point, the antenna was raised and lowered from 1 m to 4 m. The antenna was placed in both the horizontal and vertical planes.

**ANTENNA & GROUND:**

This unit uses internal antennas.

##### Method of measurement

The transmitter output was connected to a calibrated coaxial attenuator, the other end of which was connected to a spectrum analyzer. Transmitter output was read off the spectrum analyzer in dBm. The power output at the transmitter antenna port was determined by adding the value of the attenuator to the spectrum analyzer reading.

An HP power meter was also used to measure the RF power.

Tests were performed at three frequencies (low, middle, and high channels) and on all power levels, which can be set-up on the transmitters.

##### Test results

|                                   | Frequency channel | Peak output power | AVG output power |
|-----------------------------------|-------------------|-------------------|------------------|
| <b>Cellular telephone 850 MHz</b> | 128               | 33.14 dBm         | --               |
|                                   | 188               | 32.93 dBm         | --               |
|                                   | 251               | 33.03 dBm         | --               |
| <b>PCS 1900 MHz</b>               | 512               | 30.91 dBm         | --               |
|                                   | 661               | 31.28 dBm         | --               |

### 3.2 RF power output, radiated

#### Reference

|     | Cellular telephone 850 MHz | PCS 1900 MHz          |
|-----|----------------------------|-----------------------|
| FCC | CFR part 22.913(a)         | CFR part 24.232(c)    |
| IC  | RSS-132 Issue 2, §4.4      | RSS-133 Issue 3, §4.3 |

#### Method of measurement

The EUT was positioned on a non-conductive turntable, 0.8m above the ground plane on an open test site. The radiated emission at the fundamental frequency was measured at 3m distance with a test antenna and spectrum analyzer.

Worst case emission was recorded with the rotation of the turntable and the raising and lowering of the test antenna.

ERP in frequency band 824.2 - 848.8 MHz, and EIRP in frequency band 1850.2 - 1909.8 MHz were measured using a substitution method. The EUT was replaced by half-wave dipole (824.2 - 848.8 MHz) or horn antenna (1850.2 - 1909.8 MHz) connected to a signal generator.

#### Substitution RF power measurement at ETS Product Service AG

General:

The applied substitution method follows ANSI/TIA/EIA-603, ANSI/TIA/EIA-102.CAAA or the appropriate ETSI rules respectively.

The actual signal generated by the EUT can be determined by means of a substitution measurement in which a known signal source replaces the device to be measured.

- 1) Signal generator;
- 2) Substitution antenna;
- 3) Test antenna;
- 4) Spectrum analyzer or selective voltmeter.

The substitution antenna replaces the transmitter antenna at the same position and in vertical polarization. The frequency of the signal generator shall be adjusted to the measurement frequency. The test antenna shall be raised or lowered, if necessary, to ensure that the maximum signal is still received. The input signal to the substitution antenna shall be adjusted in level until an equal or a known related level to that detected from the transmitter is obtained in the measurement receiver. If a fully anechoic chamber is used as test site in order to provide free space conditions there is no need to change the height of the antenna.

The measurement will be repeated in horizontal position.

#### **Calibration:**

In order to make this kind of measurement more effective and to avoid subjective measurement faults ETS has installed automatic computer controlled measurement procedures.

With the above described substitution method a test site is calibrated over the full frequency range which is used in suitable frequency steps. For a certain power level on the substitution antenna the received power over the whole frequency range is documented. All necessary antenna gains, cable losses, filter losses and amplifications of preamplifiers are taken in consideration. The summary of this calibration measurement performs a transducer factor that is related to the considered test site and a certain measurement distance. Differences of the radiated power levels of different test samples are determined by internal attenuation of the measurement receiver. The proper function of such test site will be maintained by short term plausibility checks and periodical re-calibration.

#### **Testing:**

The test sample is put on the table at the defined position and the measurement receiver receives and documents the radiated power. On test sites with ground plane the measurement antenna will be lowered and raised to maximum values at significant frequencies.

For peak power measurements the sample is turned by the turntable over 360 degree in order to find the direction with the maximum radiation or to document the max reading with the MAXHOLD function during the rotation.

#### **Limits**

### 3.3 Occupied bandwidth, emission bandwidth

#### Reference

|            | <b>Cellular telephone 850 MHz</b> | <b>PCS 1900 MHz</b>        |
|------------|-----------------------------------|----------------------------|
| <b>FCC</b> | CFR part 22.917(b), 2.1049        | CFR part 24.238(b), 2.1049 |
| <b>IC</b>  | RSS-Gen Issue 1, §4.4.1           | RSS-Gen Issue 1, §4.4.1    |

#### Method of measurement

The occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power.

The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

The RF output of the transceiver was connected to the input of the spectrum analyzer through sufficient attenuation.

Occupied Bandwidth was measured with a occupied bandwidth function of the analyzer.

To find the Emission Bandwidth (-26 dB) the delta markers were set -26 dB below transmitter power.

#### Test results

### 3.4 Frequency stability

#### Reference

|            | <b>Cellular telephone 850 MHz</b>              | <b>PCS 1900 MHz</b>                            |
|------------|--|--|
| <b>FCC</b> | CFR part 22.355, 2.1055                        | CFR part 24.235, 2.1055                        |
| <b>IC</b>  | RSS-132 Issue 2, §4.3<br>RSS-Gen Issue 1, §4.5 | RSS-133 Issue 3, §4.2<br>RSS-Gen Issue 1, §4.5 |

#### Method of measurement

The equipment under test was connected to an external DC power supply and the RF output was connected to a frequency counter via feed through attenuators. The EUT was placed inside the temperature chamber. The DC leads and RF output cable, exited the chamber through an opening made for that purpose.

After the temperature stabilized the frequency output was recorded from the counter.

#### Method of measurement

The radio frequency voltage or powers generated within the equipment and appearing on a spurious frequency shall be checked at the equipment output terminals when properly loaded with suitable artificial antenna. Curves or equivalent data shall show the magnitude of each harmonic and other spurious emission. The magnitude of spurious emission which are attenuated more than 20 dB below the permissible value need not be specified. Tests are performed for lowest, middle and highest transmitter block frequency.

#### Method of measurement

The EUT was positioned on a non-conductive turntable, 0.8m above the ground plane. The radiated emission at the fundamental frequency was measured at 3 m distance with a test antenna and spectrum analyzer.

Worst case emission was recorded with the rotation of the turntable and the raising and lowering of the test antenna.

ERP was measured using a substitution method. The EUT was replaced by horn antenna connected to a signal generator.

The frequency range up to tenth harmonic was investigated.

The tests of spurious radiated emission have been carried out with the EKS-Software from Rohde & Schwarz.

The analyzer gives automatic the measurements of spectral plots to the EKS software.

In the 1<sup>st</sup> 1 MHz band outside the band edge nearest the channel of interest a 3 kHz res. BW is used. The measurements from 30 MHz to 1845 GHz and 1915 GHz to 26.56 GHz were performed with a measurement bandwidth of 1 MHz.

Calculation of test results:

Such factors like antenna correction, cable loss, external attenuation etc. are already included in the provided measurement results. This is done by using validated test software and calibrated test system according the accreditation requirements.

The peak and average spurious emission plots was measured with the average limits. In the Table being listed the critical peak and average value an exhibit the compliance with the above calculated Limits.

**Limits**

|            | <b>Cellular telephone 850 MHz</b> | <b>PCS 1900 MHz</b>       |
|------------|-----------------------------------|---------------------------|
| <b>FCC</b> | Pc - (43 + 10 log (P) dB)         | Pc - (43 + 10 log (P) dB) |
| <b>IC</b>  | Pc - (43 + 10 log (P) dB)         | Pc - (43 + 10 log (P) dB) |

### 3.7 Block edge compliance

#### Reference

|     | Cellular telephone 850 MHz | PCS 1900 MHz          |
|-----|----------------------------|-----------------------|
| FCC | CFR part 22.917(b)         | CFR part 24.238(b)    |
| IC  | RSS-132 Issue 2, §4.5.1.1  | RSS-133 Issue 3, §4.4 |

#### Method of measurement

In the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. A narrower resolution bandwidth is permitted in all cases to improve measurement accuracy provided the measured power is integrated over the full required measurement bandwidth.

#### Limits

|     | Cellular telephone 850 MHz            | PCS 1900 MHz                          |

### 3.8 AC power line conducted emissions

#### Reference

|     | Cellular telephone 850 MHz | PCS 1900 MHz    |
|-----|----------------------------|-----------------|
| FCC | CFR part 15.207            | CFR part 15.207 |
| IC  | Not applicable             | Not applicable  |

#### Method of measurement

For an intentional radiator which is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC line on any frequency or frequencies within the band 150 kHz to 30 MHz shall not exceed the limits. Compliance with this provision shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminals.

This measurement was transact first with instrumentation using an average and peak detector and a 10 kHz bandwidth. If the peak detector achieves a calculated level, the measurement is repeated by an instrumentation using a quasi-peak detector.

#### Limits

|     | Cellular telephone 850 MHz  | PCS 1900 MHz                          |         |
|-----|-----------------------------|---------------------------------------|---------|
|     | Frequency of emission [MHz] | Conducted limit field strength [dBµV] |         |
|     |                             | Quasi Peak                            | Average |
| FCC | 0.15 - 0.5                  | 66 to 56                              | 56 - 46 |
|     | 0.5 - 5                     | 56                                    | 46      |
|     | 5 - 30                      | 60                                    | 50      |

## 4 Receiver parameters

### 4.1 Radiated emissions

#### Reference

|            | Cellular telephone 850 MHz                    | PCS 1900 MHz                                   |
|------------|---|--|
| <b>FCC</b> | CFR part 15.109, 2.1053                       | CFR part 15.109, 2.1053                        |
| <b>IC</b>  | RSS-132 Issue 2, 4.6<br>RSS-Gen Issue 1, §4.8 | RSS-133 Issue 3, §4.5<br>RSS-Gen Issue 1, §4.8 |

#### Method of measurement

The receiver shall be operated in the normal receive mode near the mid-point of the band(s) over which the receiver is designed to operate.

The measurement method is the radiated emission measurement. The measurement starts at 30 MHz and ends at least 3 times the highest tunable local oscillator frequency (6 GHz).

#### Limits

|            | Cellular telephone 850 MHz  | PCS 1900 MHz                              |
