1.0 OVERVIEW

1.1 PRODUCT DESCRIPTION

This test plan has been prepared by Hughes Network Systems to document the required RF Type Acceptance FCC101 subparts C& H (Fixed Microwave Services) on the Point to Multipoint - Aireach product (PMP). The purpose of this testing is to determine performance against the requirements for the FCC 101 subsections mentioned.

This test plan and report will demonstrate the compliance with the FCC 101 for the Low Band (LB) and High Band (HB) Subscriber systems. This test plan and report will be later be updated with the data for the High Band (HB) Subscriber test data. The following 38-40 GHz subsystems units are/will be tested and submitted:

LB SUB (Low Band Subscriber unit) Tx (38606.25- 38943.75) MHz HNS 1028992

LB HUB (Low Band HUB unit) Tx (39306.25- 39643.75) MHz HNS 1028991

In this test plan and report we are verifying the LB HUB, the LB SUB data will be in another HNS test report HNS 1028992.

The HNS PMP provides services to carry voice and data efficiently and economically. The system is based upon multi-sector cells with TDMA/TDMA air Interface. It provides sophisticated multi-mode modulation (QPSK, 64-QAM, and 16-QAM) on a per-burst basis to efficiently handle broad ranging requirements for sector capacity and sector size.

The overall PMP network Architecture includes several elements, including the radios, the transmission equipment, and the central office equipment. The HNS portion of this system is the HNS 38 GHz Point-to Multipoint (PMP). This includes subscriber premises equipment, PMP HUB radio equipment, and interfaces to commercially available multiplexing equipment. These interfaces include the (SONET) backbone and dedicated trunks to the voice switch, as well as IP routers and other data delivery systems.

The PMP product is broken into two terminals, a hub terminal (HT) and a remote Terminal (RT). The HT is responsible on routing the data/voice signals from one RT to another. The RT is at the customer premises and comprises 3 components:

ODU: Outdoor Unit: which is an integrated 38 GHz Transceiver and antenna,

(IDU) the Indoor unit that provide modem and remote multiplexers function, and finally,

The Interfacility Link (IFL) which is a single coaxial cable that interconnects the ODU and IDU. The HT has the same main components; it supports one sector with one over-the air frequency (12.5 MHz subchannel).

Rev.1

Sheet 7 of 58

**Figure 1 Basic RT/HT Terminal**

Figure 1 shows a basic block diagram for the RT/HT system. The IFL cable shown carries DC power signal, reference carrier frequency, the Up-link and the Downlink IF signals and the telemetry control link signals. The IDU is installed indoors, often in a wiring closet. It includes the IF, modem, air frame formatting login, the IFL interface, and the subscriber interface multiplexer function in one unit. Each IDU has four multi-port SSI slots to allow for several different user interfaces. For more description of product, it's operation and functionality, please refer to the DDD (Detailed Design document) HNS –13880.

1.2 CHANNELIZATION

The channelization, taken from the FCC regulations, CFR-47& 101.147 Frequency assignments, is given in Table 1.1. The HNS product further divides each 50 MHz license into four 12.5 MHz sub-channels (see figure 2) The first number and the first letter of each designator are the FCC number for the channel. The last number is the sub-channel designator. The figure shows the designation of FCC channel 1-A. Each of these sub-channels operates at a symbol rate of 10.0Msps in the TDMA mode. The QPSK Spectral Density is 20Mbps in 12.5 MHz or 1.6 bits/s/Hz and the 64-QAM spectral density is 60Mbps in 12.5 MHz or 4.8 bits/s/Hz

2.0 SETUP

This section documents the RF transmit and receive test setup, parts and test equipment used. Table 2 in section 2.1 lists the EUT (Equipment Under Test) that are subject for testing for FCC 101, with part numbers and revision levels. Table 3 lists the EUT equipment was used to generate the traffic to the ODU. Table 4 lists the test equipment and their calibration dates used to support the test. Section 2.2 shows the various test configuration diagrams. The measurements will be done using a HP 8564E series Spectrum Analyzer as the final measuring device. All the data plots will be captured via HP Bench screen capture software and saved as *.GIF images which may then be inserted into test report documents digitally. The EUT is configured for transmission mode using custom software prepared by Hughes Network Systems for channel selection and simulation of the signals that are normally transmitted to the Hub terminal

2.2 TEST SETUPS

This section documents the test plan, and requirements for the transmitter testing.

Figure 3 Transmitter Test Setup Configuration

Figure 4 Transmitter Test Setup Configuration – Conducted Spurious Emissions

Figure 5 Transmitter Test Setup Configuration – Radiated Spurious Emissions

3.0 TRANSMITTER TESTS

3.1 THE OUTPUT POWER

This test demonstrates the maximum transmitter power level of the EUT antenna output. The maximum power transmitted will be 18.0 dBm at the Antenna port. All the measurements are with + 1dB of tolerance.

3.1.1 Performance Specifications

As per FCC CFR 47 Part 2.1046 (previously 2.985) and 101.113

EIRP Max = +55dBW after the antenna. The Subscriber Antenna has a gain of 40.5 dBi.

Therefore the maximum allowable limit is

55dBw= 85 dBm

Maximum allowable transmitted power from the Antenna port is for the transmitting bands:

PTx max = 85dBm- 40.5 dB = 44.5 dBm in 1MHz Resolution Bandwidth.

In 100 kHz Resolution Bandwidth, the limit will be 10dB lower, i.e., 34.5dBm.

3.1.2 Test Procedures

The equipment under test will be operated at different frequencies across the transmit frequency band (low end, center, and high end of the FCC authorized bands. The modulated carrier and CW power levels will be monitored and data plots will be obtained for each modulation type. There are 3 types of modulations (QPSK, 16-QAM, and 64-QAM). For each antenna gain, the Gain (in dBi) will be added to the level of the transmitted power (dBm). The RMS power of the Tx signal is measured using a HP power meter with a power sensor adapter that ranges up to 50 GHz. The spectral analyzer will also be used to display the modulated Tx signal in addition to the power level of the signal. Since the spectral analyzer can't give a very accurate reading in reading the power of a modulated signal, we will base our reading on the power meter reading. The reading was taken from the Power Meter, and the difference between the SA reading of the CW transmitted power was taken into account by adding an offset to the reference level in SA.

. The following channels will be used according to the band tested.

No.		HNS-21937
Rev.1		Sheet 16 of 58

3.1.3 Test Configuration

Please reference to Figure 3 for the test configuration used during this test.

a. Spectrum Analyzer setup:

Channel Power test

Channel spacing -(12.5 MHz)

Channel Bandwidth (12.5Mhz)

Resolution Bandwidth - >100kHz

Video Bandwidth - >100kHz

Amplitude Units dBm

b. Power meter Setup

The actual RMS transmit power = power meter reading + attenuation + coupler losses.

3.1.4 Test Results

LB HUB				
Channel	Frequency MHz	QPSK	16-QAM	64-QAM
		P _{Tx} (dBm)	P _{Tx} (dBm)	P _{Tx} (dBm)
1A1	39306.25	18	18	18
4A3	39481.25	18	18	18
7A4	39643.75	18	18	18

Table 5 Test Results for the Output Power

Please refer to the attached plots for the output power. Graphs show the carrier and the signal with different modulations (QPSK, 64-QAM, and 16-QAM), on low channel (1A1), mid-channel (4A3), and high-channel (7A4). The maximum output power is 18dBm. + 1dB tolerance.

3.2 OCCUPIED BANDWIDTH

This test demonstrates that occupied bandwidth of the transmitter is within the FCC 101.109 requirements.

3.2.1 Performance Specifications

As per FCC CFR 47 Part 2.1050 (previously 2.989) and 101.109

Maximum authorized bandwidth 50MHz. Unwanted emissions must be suppressed at the aggregate channel block edges based on the same roll-off rate as specified for a single channel block in 101.111 (a) (ii) and (iii).

(a)(2)(ii) In 1 MHz Band: 50% to 250%: $A = 11 + 0.4(P - 50) + 10\log(B)$ or no less than 11dB down but no more than 56dB down is required

Where: A = Attenuation in dB below mean output power level

P = percent removed from center frequency

B = Authorized bandwidth in MHz

Example calculation:

If your bandwidth is 50 MHz

At 50 %: $A = 11 + .4(50 - 50) + 10\log(50) = 28\text{dB down}$

At 250%: $A = 11 + .4(250 - 50) + 10\log(50) = 108\text{ dB so use }56\text{ dB down}$

In 100 kHz resolution bandwidth, the limits are 10dB lower. For the maximum power of 18 dBm, at 50% the limit will be 38dB down, i.e., -20dBm. At 250%, the limit will be 66 dB down, i.e., -48dBm.

(a)(2)(iii) In 4kHz band >250% at least $43 + 10\log(\text{output power in Watts})$ or 80dB

Example calculation:

If your power were = 18dBm = 63.1mW = 0.0631W

250% and out: $A = 43 + 10\log(0.0631) = 31\text{dB down, i.e., }-13\text{dBm}$

Note: 4 kHz Bandwidth will be difficult to use. You may adjust the limit accordingly. If it passes at the higher bandwidth, it will certainly pass at 4 kHz.

3.2.2 Test Procedures

The equipment under test will be operated at different frequencies across the transmit frequency band (low end and high end). The modulated carrier will be examined and the occupied bandwidth will be viewed for compliance.

Test Frequencies	
Channel	Frequency MHz
1-A	39300-39350
7-A	39600-39650

Table 6 Occupied Bandwidth Test Frequencies

Rev.1	
Sheet 23 of 58	

3.2.3 Test Configuration

Please reference to Figure 3 for the test configuration used during this test.

The test limit has been determined as shown in the following figure. The mask is based on 100kHz Resolution Bandwidth. According to the FCC, the maximum allowable power is 34.5dBm. However, the maximum output transmit power is 18dBm.

50 % points = 39300 MHz, 39650MHz, allowable level = -20dBm

From 50% to 250% points = based on the given equation, limited to -48dBm. This point is reached at about 120% points.

250% points = 39200 MHz, 39750 MHz., allowable level = -48dBm

250% and beyond, allowable level = -13dBm.

Resolution Bandwidth – 100 kHz

Video Bandwidth – 100 kHz

3.2.4 Test Results

The graphs for the occupied bandwidth signals are shown in the following pages. The output transmitted channel power is 18dBm. All the modulation schemes (QPSK, 64-QAM, and 16-QAM) are investigated. The top graph shows the left-hand side channel with the associated limit, and the bottom graph shows the right hand side channel with the associated limit.

3.3 CONDUCTED SPURIOUS EMISSIONS FROM THE TRANSMITTER

These tests demonstrate the spurious emission levels, which are produced by EUT at the antenna terminals. The tests for the conducted emissions document the spurious levels conducted from the transmit filter output port (antenna connector), which connects to the transmit antenna.

3.3.1 Performance Specifications

As per FCC CFR 47 Part 2.1050 (previously 2.989) and 101.109

Maximum authorized bandwidth 50MHz. Unwanted emissions must be suppressed at the aggregate channel block edges based on the same roll-off rate as specified for a single channel block in 101.111 (a) (ii) and (iii).

(a)(2)(ii) In 1 MHz Band: 50% to 250%: $A = 11 + 0.4(P - 50) + 10\log(B)$ or no less than 11dB down but no more than 56dB down is required

Where: A = Attenuation in dB below mean output power level

P = percent removed from center frequency

B = Authorized bandwidth in MHz

Example calculation:

If your bandwidth is 50 MHz

At 50 %: $A = 11 + .4 (50 - 50) + 10\log(50) = 28\text{dB down}$

At 250%: $A = 11 + .4 (250 - 50) + 10\log(50) = 108 \text{ dB}$ so use 56 dB down

In 100 kHz resolution bandwidth, the limits are 10dB lower. For the maximum power of 18dBm, at 50% the limit will be 38dB down, i.e., -20dBm. At 250%, the limit will be 66 dB down, i.e., -48dBm.

(a)(2)(iii) In 4kHz band >250% at least $43 + 10\log(\text{output power in Watts})$ or 80dB

Example calculation:

If your power were = 18dBm = 63.1mW = 0.0631W

250% and out: $A = 43 + 10\log(0.0631) = 31\text{dB down}$, i.e., -13dBm

Note: 4 kHz Bandwidth will be difficult to use. You may adjust the limit accordingly. If it passes at the higher bandwidth, it will certainly pass at 4 kHz.

3.3.2 Test Procedures

The EUT will be initialized in the transmit mode. The transmit output will be connected to the spectrum analyzer. Spurious emissions measurements will be done in the frequency bands detailed above.

The equipment under test will be operated at different frequencies across the transmit frequency band (low end and high end). The entire frequency spectrum from as low as possible to 220 GHz shall be investigated and any spur or emission shall be documented.

Test Frequencies	
Channel	Center-Frequency MHz
1-A-1	39306.25
7-A-4	39643.75

Table 7 Conducted Spurious Emissions Test Frequencies

No.	
HNS-21937	
Rev.1	
Sheet 29 of 58	

3.3.3 Test Configuration

Refer to Fig. 4 for the Basic Test configuration.

Transitions and waveguide adapters will need to be used to connect the EUT transmit port to the various harmonic mixers. The mixers along with a Diplexer will be used to connect the signal to the spectrum analyzer and mix it down to a frequency range that can be measured. This must be done since the analyzer used only goes to 40 GHz and signals must be measured up to 220 GHz. Please refer to the documentation supplied with the mixers for instructions on how to make measurements. Also note that any measurements made over 40 GHz will not be calibrated, they will only be referenced upon the factors supplied by the mixer manufacturer. There are no NIST traceable measurements above 75GHz(they may be up to 97GHz now). Therefore, we must use engineering judgment when taking these measurements. Care must be taken to not overload the mixers. Also care must be taken when connecting and disconnecting the waveguide pieces.

The following connections will need to be made:

EUT has WR-28

Adapter	Cable	Frequency Range
WR-28 to 2.4mm connector	Low loss to 40 GHz	0 to 40 GHz
Transition	Mixer	Frequency Range
WR-28 to WR-19	WR-19	40 to 60 GHz
WR-28 to WR-12	WR-12	60 to 90 GHz
WR-28 to WR-08	WR-08	90 to 140 GHz
WR-28 to WR-05	WR-05	140 to 220 GHz

3.3.4 Test Results

The following Figures show the conducted spurious emissions, when the ODU is transmitting high power 18dBm, and low power -12dBm. Measurements are performed while transmitting on two channels (low end 1A1 and high end 7A4). The frequency of consideration is from 0Hz to 220GHz. The 250% band (39200MHz-39750MHz) is excluded as this range has been covered in the previous section (3.2)

3.4 RADIATED SPURIOUS EMISSIONS FROM THE TRANSMITTER

These tests demonstrate the spurious emission levels, which are produced by EUT. The tests for the radiated emissions document the spurious levels radiated from the EUT enclosure and cables, while the transmit output port (antenna connector) will be terminated by a “dummy load”.

3.4.1 Performance Specifications

As per FCC CFR 47 Part 2.1050 (previously 2.989) and 101.109

Maximum authorized bandwidth 50MHz. Unwanted emissions must be suppressed at the aggregate channel block edges based on the same roll-off rate as specified for a single channel block in 101.111 (a) (ii) and (iii).

(a)(2)(ii) In 1 MHz Band: 50% to 250%: $A = 11 + 0.4(P - 50) + 10\log(B)$ or no less than 11dB down but no more than 56dB down is required

Where: A = Attenuation in dB below mean output power level

P = percent removed from center frequency

B = Authorized bandwidth in MHz

Example calculation:

If your bandwidth is 50 MHz

At 50 %: $A = 11 + 0.4(50 - 50) + 10\log(50) = 28\text{dB down}$

At 250%: $A = 11 + 0.4(250 - 50) + 10\log(50) = 108\text{ dB}$ so use 56 dB down

In 100 kHz resolution bandwidth, the limits are 10dB lower. For the maximum power of 18dBm, at 50% the limit will be 38dB down, i.e., -20dBm. At 250%, the limit will be 66 dB down, i.e., -48dBm.

(a)(2)(iii) In 4kHz band >250% at least $43 + 10\log(\text{output power in Watts})$ or 80dB

Example calculation:

If your power were = 18dBm = 63.1mW = 0.0631W

250% and out: $A = 43 + 10\log(0.0631) = 31\text{dB down}$, i.e., -13dBm

Note: 4 kHz Bandwidth will be difficult to use. You may adjust the limit accordingly. If it passes at the higher bandwidth, it will certainly pass at 4 kHz.

3.4.2 Test Procedures

The EUT will be initialized in the transmit mode. The transmit output will be terminated by a “dummy load”. Spurious emissions measurements will be done in the frequency bands detailed above.

The equipment under test will be operated at different frequencies across the transmit frequency band (low end, center, and high end). The entire frequency spectrum from as low as possible to 220 GHz shall be investigated and any spur or emission shall be documented.

3.4.3 Test Configuration

Refer to Fig. 5 for the Basic Test configuration.

Standard gain horn antennas and harmonic mixers will be used to take the measurements. The mixers along with a Diplexer will be used to connect the signal to the spectrum analyzer and mix it down to a frequency range that can be measured. This must be done since the analyzer used only goes to 40 GHz and signals must be measured up to 200 GHz. Please refer to the documentation supplied with the mixers for instructions on how to make measurements. Also note that any measurements made over 40 GHz will not be calibrated, they will only be referenced upon the factors supplied by the mixer manufacturer. There are no NIST traceable measurements above 75GHz(they may be up to 97GHz now). Therefore, we must use engineering judgment when taking these measurements. Care must be taken to not overload the mixers. Also care must be taken when connecting and disconnecting the waveguide pieces and horn antennas.

The following connections will need to be made:

Antenna	Connector	Adapter	Frequency Range
Bi-Log	Type N	N/A	30 to 1000 MHz
Horn	Type N	N/A	1 to 18 GHz
Standard Gain Horn	WR-42	WR-42 to 3.5mm connector	18 to 26.5GHz
Standard Gain Horn	WR-28	WR-28 to 2.4mm connector	26.5 to 40 GHz
Antenna	Connector	Mixer	Frequency Range
Standard Gain Horn	WR-19	WR-19	40 to 60 GHz
Standard Gain Horn	WR-12	WR-12	60 to 90 GHz
Standard Gain Horn	WR-08	WR-08	90 to 140 GHz
Standard Gain Horn	WR-05	WR-05	140 to 220 GHz

Table 9 Equipment for Radiated Emissions Test

Recommend that test distance be 3m below 18Ghz and 1m above.

3.4.4 Test Results

The following Figures show the plots for the horizontal polarization (HP) for the frequency range of 1 GHz - 220GHz and for the vertical polarization (VP) for the same frequency range.

3.5 FREQUENCY STABILITY

This test demonstrates the frequency stability of the EUT over the temperature ranges of the equipment.

3.5.1 Performance Specifications

NOTE: Equipment in the 38.6 to 40 GHz range is exempt from this requirement under 101.107

3.5.2 Test Results

Our Engineering department has performed frequency stability evaluation and has provided a letter that is shown on the next page.

Re: Point to Multipoint Frequency Tolerance

Point to Multipoint Frequency Tolerance

The point to multipoint equipment frequency stability is traceable to the CCM crystal timebase, which in turn is phase locked to network timing with Sonet Stratum 3 stability or better. This results in frequency stability of the RF systems to within ± 4.6 ppm.

This meets the FCC 101.107 and Frequency Tolerance
