|   | This device has been shown to be capable of compliance for localized specific absorption rate (SAR) for uncontrolled environment/general population exposure limits specified in FCC KDB procedures and had been tested in accordance with the measurement procedures specified in FCC KDB procedures. I attest to the accuracy of data. All measurements reported herein were performed by me or were made under my supervision and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these |

The result shown in this test report refer only to the sample(s) tested unless otherwise stated.

measurements and vouch for the qualifications of all persons taking them.

Tested by In Ho Park

Parkinho Yis

Technical Manager Yun Jeang Heo

#### **REVISION HISTORY**

The revision history for this test report is shown in table.

| Revision No. | Date of Issue | Description     |

## 1. Test Regulations

The tests were performed according to the following regulations:

| Test Standard | IEEE Standard 1528-2013 & KDB procedures  |  |  |
|---------------|---|--|--|
| Test Method   | <ul> <li>FCC KDB Publication 447498 D01 General SAR Guidance v06</li> <li>FCC KDB Publication 865664 D01 SAR measurement 100 MHz to 6 GHz v01r04</li> <li>FCC KDB Publication 865664 D02 SAR Reporting v01r02</li> <li>FCC KDB Publication 643646 D01 SAR Test for PTT Radios v01r03</li> </ul> |  |  |

## 2. Test Location

## 2.1 Test Laboratory

| Company Name | HCT Co., Ltd.  |  |
|--------------|--|--|
| Address      | 74, Seoicheon-ro 578beon-gil, Majang-myeon, Icheon-si,<br>Gyeonggi-do, 17383 KOREA |  |
| Telephone    | 031-645-6300   |  |
| Fax.         | 031-645-6401   |  |

## 3. Information of the EUT

## 3.1 General Information of the EUT

| Model Name     | NX-1200-K, NX-1200-K2, NX-1202-K |  |
|----------------|----------------------------------|--|
| Equipment Type | VHF TRANSCEIVER                  |  |
| FCC ID         | K44501000                        |  |
| Applicant      | JVCKENWOOD Corporation           |  |

## 3.2 DUT description

7 Key with LCD

non Key, non LCD

\* Tow type of sample comparison result 7 key with LCD type SAR is high, so the entire test is proceeded.

#### 3.3 Attestation of test result of device under test

| The Highest Reported SAR (W/Kg)           |                          |                 |                            |                     |
|---|--------------------------|-----------------|----------------------------|---------------------|
|   | Tx. Frequency            |                 | Reported 1g SAR SAR (W/kg) |                     |
| Band                                      | Band (MHz) Equipment Cia | Equipment Class | Hand-held to Face          | Body-Worn Belt clip |
| VHF (FCC)                                 | 150 ~ 174                | TNF             | 2.45                       | 2.72                |
| Simultaneous SAR per KDB 690783 D01v01r03 |                          |                 | 1                          | V/A                 |
| Date(s) of Tests:                         | Jul. 11, 2019 ~ Jul.     | 15, 2019        |                            |                     |

Note : The Duty Cycle of PTT was 50% applied.

#### 4. Output Power Specifications

This device operates using the following maximum output power specifications. SAR values were scaled to the maximum allowed power to determine compliance per KDB publication 447498 D01v06.

#### 4.1 Maximum Output Power

| Band | Frequency         | Power       |
|------|-------------------|-------------|
| VHF  | 150 MHz ~ 174 MHz | 5 W (±0.2W) |
| VHF  | 150 MHz ~ 174 MHz | 2 W         |

#### 4.2 Output Average Conducted Power

(5 W)

| Frequency (MHz) | Туре   | Channel | Power (dBm) |
|-----------------|--------|---------|-------------|
| 150.05          | Analog | 1       | 36.84       |
| 158.05          | Analog | 2       | 36.83       |
| 166.00          | Analog | 3       | 36.74       |
| 173.95          | Analog | 4       | 36.70       |

(2W)

| Frequency (MHz) | Туре   | Channel | Power (dBm) |
|-----------------|--------|---------|-------------|
| 150.05          | Analog | 1       | 33.32       |
| 158.05          | Analog | 2       | 33.21       |
| 166.00          | Analog | 3       | 33.17       |
| 173.95          | Analog | 4       | 33.23       |

For FCC Band:

Per KDB 447498 D01v06 Page 7 section 6) pages 7-8, the number of channels required to be tested is as follows.

$$\begin{split} F_{high} &= 174 \ \text{MHz} \\ F_c &= 162 \ \text{MHz} \\ F_{Low} &= 150 \ \text{MHz} \\ N_c &= \text{Round} \left\{ [100(f_{high} - f_{low}) \ / \ f_c]^{0.5} \ \text{X} \ (f_c \ / \ 100)^{0.2} \} = \text{Re} \end{split}$$

 $N_{c} = Round \{ [100(f_{high} - f_{low}) / f_{c}]^{0.5} X (f_{c} / 100)^{0.2} \} = Round \{ [100(174-150) / 162]^{0.5} X (162/100)^{0.2} \} = 4$ Therefore, for the frequency band from 150 MHz to 174, 4channels are required for testing.

# 5. Manufacturer's Accessory List

| Part Nol.  | Description                                   | Accessory Type          | Accessory |
|------------|---|-------------------------|-----------|
| KRA-22M    | VHF Low Profile Helical Antenna (146-162 MHz) |                         | 1         |
| KRA-22M2   | VHF Low Profile Helical Antenna (162-174 MHz) | -                       | 2         |
| KRA-22M3   | VHF Low Profile Helical Antenna (135-150 MHz) | -                       | 3         |
| KRA-26M    | VHF Helical Antenna (146-162 MHz)             |                         | 4         |
| KRA-26M2   | VHF Helical Antenna (162-174 MHz)             | antenna                 | 5         |
| KRA-26M3   | VHF Helical Antenna (135-150 MHz)             | -                       | 6         |
| KRA-41M    | VHF Stubby antenna (146-162 MHz)              | -                       | 7         |
| KRA-41M2   | VHF Stubby antenna (162-174 MHz)              | -                       | 8         |
| KRA-41M3   | VHF Stubby antenna (136-150 MHz)              | -                       | 9         |
| KNB-45L    | Li-Ion Battery Pack (2,000mA)                 |                         | 1         |
| KNB-53N    | Ni-MH Battery Pack (1,400mA)                  | -                       | 2         |
| KNB-29N    | Ni-MH Battery Pack (1,500mA)                  | Battery                 | 3         |
| KNB-69L    | Li-ion Battery Pack (2,550mA)                 | -                       | 4         |
| KNB-82LC   | Li-ion Battery Pack for IS (1,900mA)          |                         | 5         |

| KNB-82LC | Li-ion Battery Pack for IS (1,900 mA) | WHD 54.0 x 114.7 x 17.7 |

This SAR report is the result of a change test for the addition of a battery Since the additional battery has the biggest capacity of the battery, the Head Face SAR test were performed the Full SAR test and the body worn SAR were evaluated under the worst case condition of the original SAR report.

#### Radio Body Test (Body-Worn)

\* Manufacture's disclosed accessory listing information provided by Kenwood corporation.

## 6. Introduction

The FCC has adopted the guidelines for evaluating the environmental effects of radio frequency radiation in ET Docket 93-62 on Aug. 6, 1996 to protect the public and workers from the potential hazards of RF emissions due to FCC-regulated portable devices.

The safety limits used for the environmental evaluation measurements are based on the criteria published by the American National Standards Institute (ANSI) for localized specific absorption rate (SAR) in IEEE/ANSI C95.1-1992 Standard for Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz to 300 GHz. 1992 by the Institute of Electrical and Electronics Engineers, Inc., New York 10017. The measurement procedure described in IEEE/ANSI C95.3-1992 Recommended Practice for the Measurement of Potentially Hazardous Electromagnetic Fields - RF and Microwave is used for guidance in measuring SAR due to the RF radiation exposure from the Equipment Under Test (EUT). These criteria for SAR evaluation are similar to those recommended by the National Council on Radiation Protection and Measurements (NCRP) in Biological Effects and Exposure Criteria for Radio Frequency Electromagnetic Fields," NCRP Report No. 86 NCRP, 1986, Bethesda, MD 20814. SAR is a measure of the rate of energy absorption due to exposure to an RF transmitting source. SAR values have been related to threshold levels for potential biological hazards.

#### SAR Definition

Specific Absorption Rate (SAR) is defined as the time derivative of the incremental electromagnetic energy (dW) absorbed by (dissipated in) an incremental mass (dm) contained in a volume element (dV) of a given density (r). It is also defined as the rate of RF energy absorption per unit mass at a point in an absorbing body.

$$SAR = \frac{d}{d t} \left( \frac{d U}{d m} \right)$$

Figure 1. SAR Mathematical Equation SAR is expressed in units of Watts per Kilogram (W/kg)  $SAR = \sigma E^2 / \rho$ 

Where:

 $\begin{aligned} \sigma &= \text{conductivity of the tissue-simulant material (S/m)} \\ \rho &= \text{mass density of the tissue-simulant material (kg/m')} \\ E &= \text{Total RMS electric field strength (V/m)} \end{aligned}$ 

NOTE: The primary factors that control rate of energy absorption were found to be the wavelength of the incident field in relations to the dimensions and geometry of the irradiated organism, the orientation of the organism in relation to the polarity of field vectors, the presence of reflecting surfaces, and whether conductive contact is made by the organism with a ground plane.

## 7. Description of test equipment

#### 7.1 SAR MEASUREMENT SETUP

These measurements are performed using the DASY4 automated dosimetric assessment system. It is made by Schmid & Partner Engineering AG (SPEAG) in Zurich, Switzerland. It consists of high precision robotics system (Staubli), robot controller, Pentium III computer, near-field probe, probe alignment sensor, and the generic twin phantom containing the brain equivalent material. The robot is a six-axis industrial robot performing precise movements to position the probe to the location (points) of maximum electromagnetic field (EMF) (see Figure.2).

A cell controller system contains the power supply, robot controller, teach pendant (Joystick), and remote control, is used to drive the robot motors. The PC with Windows XP or Windows 7 is working with SAR Measurement system DASY4 & DASY5, A/D interface card, monitor, mouse, and keyboard. The Staubli Robot is connected to the cell controller to allow software manipulation of the robot. A data acquisition electronic (DAE) circuit performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. is connected to the Electro-optical coupler (EOC). The EOC performs the conversion from the optical into digital electric signal of the DAE and transfers data to the PC plug-in card.

Figure 2. HCT SAR Lab. Test Measurement Set-up

The DAE consists of a highly sensitive electrometer-grade preamplifier with auto-zeroing, a channel and gainswitching multiplexer, a fast 16 bit AD-converter and a command decoder and control logic unit. Transmission to the PC-card is accomplished through an optical downlink for data and status information and an optical uplink for commands and clock lines. The mechanical probe mounting device includes two different sensor systems for frontal and sidewise probe contacts. They are also used for mechanical surface detection and probe collision detection. The robot uses its own controller with a built in VME-bus computer. The system is described in detail in.

#### 7.2 ELI Phantom

Phantom for compliance testing of handheld and body-mounted wireless devices in the frequency range of 30 MHz to 6 GHz. ELI is fully compatible with the IEC 62209-2 standard and all known tissue simulating liquids. ELI has been optimized regarding its performance and can be integrated into our standard phantom tables. A cover prevents evaporation of the liquid. Reference markings on the phantom allow installation of the complete setup, including all predefined phantom positions and measurement grids, by teaching three points. The phantom is compatible with all SPEAG diametric probes and dipoles.

Figure 6.1 ELI Phantom

Shell Thickness Filling Volume Dimensions 2.0 ± 0.2mm approx. 30 liters Major axis: 600 mm, Minor axis: 400 mm

#### 7.3 Device Holder for Transmitters

Device Holder – Mounting Device

In combination with the SAM Phantom, the Mounting Device enables the rotation of the mounted transmitter in spherical coordinates whereby the rotation points is the ear opening. The devices can be easily, accurately, and repeatable positioned according to the EN 50360:2001/A:2001 and FCC KDB specifications. The device holder can be locked at different phantom locations (left head, right head, flat phantom).

Note: A simulating human hand is not used due to the complex anatomical and geometrical structure of the hand that may produced infinite number of configurations. To produce the Worst-case condition (the hand absorbs antenna output power), the hand is omitted during the tests.

#### 7.4 Validation Dipole

The reference dipole should have a return loss better than -20 dB (measured in the setup) at the resonant frequency to reduce the uncertainty in the power measurement.

#### CLA Dipole

|                     | System Validation Dipole   |  |
|---------------------|--|--|

| Dimension           | CLA150: dipole length : 222.0 mm; overall height : 95.0 mm   |  |

#### 7.5 Brain & Muscle Tissue Simulating Mixture Characterization

The brain and muscle mixtures consist of a viscous gel using hydrox-ethyl cellulose (HEC) gelling agent and saline solution (see Table 1). Preservation with a bactericide is added and visual inspection is made to make sure air bubbles are not trapped during the mixing process. The mixture is calibrated to obtain proper dielectric constant (permittivity) and conductivity of the desired tissue. The mixture characterizations used for the brain and muscle tissue simulating liquids are according to the data by C. Gabriel and G. Hartsgrove.

| Frequency (MHz)                          | 30    | 50    | )     | 14    | 14    | 4     | 50   | 835   | 900   |      |

#### 8. SAR Measurement Procedure

The evaluation was performed using the following procedure compliant to FCC KDB Publication 865664 D01v01r04 and IEEE 1528-2013

- 1. The SAR distribution at the exposed side of the head or body was measured at a distance no more than 5.0 mm from the inner surface of the shell. The area covered the entire dimension of the DUT's head and body area and the horizontal grid resolution was depending on the FCC KDB 865664 D01v01r04 table 4-1 & IEEE 1528-2013.
- 2. Based on step, the area of the maximum absorption was determined by sophisticated interpolations routines implemented in DASY software. When an Area Scan has measured all reachable point. DASY system computes the field maximal found in the scanned are, within a range of the maximum. SAR at this fixed point was measured and used as a reference value.
- 3. Around this point, a volume was assessed according to the measurement resolution and volume size requirements of FCC KDB 865664 D01v01r04 table 4-1 and IEEE 1528-2013. On the basis of this data set, the spatial peak SAR value was evaluated with the following procedure (reference from the DASY manual.)

a. The data at the surface were extrapolated, since the center of the dipoles is no more than 2.7 mm away from the tip of the probe (it is different from the probe type) and the distance between the surface and the lowest measuring point is 1.2 mm. The extrapolation was based on a least square algorithm. A polynomial of the fourth order was calculated through the points in z-axes. This polynomial was then used to evaluate the points between the surface and the probe tip.

b. The maximum interpolated value was searched with a straight-forward algorithm. Around this maximum the SAR values averaged over the spatial volumes (1 g or 10 g) were computed using the 3D-Spline interpolation algorithm. The 3D-spline is composed of three one-dimensional splines with the "Not a knot" condition (in x, y, and z directions. The volume was integrated with the trapezoidal algorithm. One thousand points (10 x 10 x 10) were interpolated to calculate the average.

c. All neighboring volumes were evaluated until no neighboring volume with a higher average value was found.

4. The SAR reference value, at the same location as step 2, was re-measured after the zoom scan. If the value changed by more than 5 %, the SAR evaluation and drift measurements were repeated.

Area scan and zoom scan resolution setting follow KDB 865664 D01v01r04 quoted below.

|   |                          |  | ≤ 3 GHz                            | > 3 GHz   |

| Minimum zoom scan<br>volume   | x, y, z                  |  | ≥ 30 mm                            | 3-4 GHz: ≥28 mm<br>4-5 GHz: ≥25 mm<br>5-6 GHz: ≥22 mm |

Note:  $\delta$  is the penetration depth of a plane-wave at normal incidence to the tissue medium; see draft standard IEEE P1528-2011 for details.

\* When zoom scan is required and the reported SAR from the area scan based 1-g SAR estimation procedures of KDB 447498 is  $\leq$  1.4 W/kg,  $\leq$  8 mm,  $\leq$  7 mm and  $\leq$  5 mm zoom scan resolution may be applied, respectively, for 2 GHz to 3 GHz, 3 GHz to 4 GHz and 4 GHz to 6 GHz.

## 9. Description of Test Position

#### 9.1 Body Holster/Belt Clip Configurations

Body-worn operating configurations are tested with the belt-clips and holsters attached to the device and positioned against a flat phantom in a normal use configuration. A device with a headset output is tested with a headset connected to the device. Body dielectric parameters are used.

Accessories for Body-worn operation configurations are divided into two categories: those that do not contain metallic components and those that contain metallic components. When multiple accessories that do not contain metallic components are supplied with the device, the device is tested with only the accessory that dictates the closest spacing to the body. Then multiple accessories that contain metallic components are tested with each accessory. If multiple accessory share an identical metallic component (i.e. the same metallic belt-clip used with different holsters with no other metallic components) only the accessory that dictates the closest spacing to the body is tested.

Body-worn accessories may not always be supplied or available as options for some Devices intended to be authorized for body-worn use. In this case, a test configuration with a separation distance between the back of the device and the flat phantom is used.

Since this EUT does not supply any body worn accessory to the end user a distance of 0 cm from the EUT back surface to the liquid interface is configured for the generic test.

"See the Test SET-UP Photo"

Transmitters that are designed to operate in front of a person's face, as in push-to-talk configurations, are tested for SAR compliance with the front of the device positioned to face the flat phantom. For devices that are carried next to the body such as a shoulder, waist or chest-worn transmitters, SAR compliance is tested with the accessory(ies), Including headsets and microphones, attached to the device and positioned against a flat phantom in a normal use configuration.

In all cases SAR measurements are performed to investigate the worst-case positioning. Worst case positioning is then documented and used to perform Body SAR testing.

#### 9.2 Hand-held to Face device

A typical example of a front-of-face device is a two-way radio that is held at a distance from the face of the user when transmitting. In these cases the device under test shall be positioned at the distance to the phantom surface that corresponds to the intended use as specified by the manufacturer in the user instructions. If the intended use is not specified, a separation distance of 25 mm<sup>5</sup> between the phantom surface and the device shall be used.

## 10. RF Exposure Limits

| HUMAN EXPOSURE   | UNCONTROLLED<br>ENVIRONMENT<br>General Population<br>(W/kg) or (mW/g) | CONTROLLED<br>ENVIRONMENT<br>Occupational<br>(W/kg) or (mW/g) |
|--|---|---|
| SPATIAL PEAK SAR *<br>(Brain)                          | 1.60  | 8.00  |
| SPATIAL AVERAGE SAR **<br>(Whole Body)                 | 0.08  | 0.40  |
| SPATIAL PEAK SAR ***<br>(Hands / Feet / Ankle / Wrist) | 4.00  | 20.00   |

#### Table 8.1 Safety Limits for Partial Body Exposure

NOTES:

- \* The Spatial Peak value of the SAR averaged over any 1 g of tissue (defined as a tissue volume in the shape of a cube) and over the appropriate averaging time.
- \*\* The Spatial Average value of the SAR averaged over the whole-body.
- \*\*\* The Spatial Peak value of the SAR averaged over any 10 g of tissue (defined as a tissue volume in the shape of a cube) and over the appropriate averaging time.

Uncontrolled Environments are defined as locations where there is the exposure of individuals who have no knowledge or control of their exposure. The general population/uncontrolled exposure limits are applicable to situations in which the general public may be exposed or in which persons who are exposed as a consequence of their employment may not be mad fully aware of the potential for exposure or cannot exercise control over their exposure. Members of the general public would come under this category when exposure is not employment-related; for example, in the case of a wireless transmitter that exposes persons in its vicinity.

**Controlled Environments** are defined as locations where there is exposure that may be incurred by persons who are aware of the potential for exposure, (i.e.as a result of employment or occupation). In general, occupational/controlled exposure limits are applicable to situations in which persons are exposed as a consequence of their employment, who have been made fully aware of the potential for exposure and can exercise control over their exposure. This exposure category is also applicable when the exposure is of a transient nature due to incidental passage through a location where the exposure levels may be higher than the general population/uncontrolled limits, but the exposed person is fully aware of the potential for exposure and can exercise control over his or her exposure by leaving the area or by some other appropriate means.

## 11. System Verification

#### 11.1 Tissue Verification

The Head /body simulating material is calibrated by HCT using the DAKS 3.5 to determine the conductivity and permittivity.

|                  | Table for Head Tissue Verification |                |                |                                     |                                       |                                   |                                     |         |         |  |  |

#### 11.3 System Verification Procedure

SAR measurement was prior to assessment, the system is verified to the  $\pm$  10 % of the specifications at each frequency band by using the system verification kit. (Graphic Plots Attached)

- Cabling the system, using the verification kit equipment.
- Generate about 100 mW Input level from the signal generator to the Dipole Antenna.
- Dipole antenna was placed below the flat phantom.
- The measured one-gram SAR at the surface of the phantom above the dipole feed-point should be within 10 % of the target reference value.
- The results are normalized to 1 W input power.

Note;

SAR Verification was performed according to the FCC KDB 865664 D01v01r04.

#### 12.3 SAR Test Notes

#### General Notes:

- 1. The test data reported are the worst-case SAR values according to test procedures specified in IEEE 1528-2013, FCC KDB Procedure.
- 2. Batteries are fully charged at the beginning of the SAR measurements. A standard battery was used for all SAR measurements.
- 3. Liquid tissue depth was at least 15.0 cm for all frequencies.
- 4. The manufacturer has confirmed that the device(s) tested have the same physical, mechanical and thermal characteristics and are within operational tolerances expected for production units.
- 5. SAR results were scaled to the maximum allowed power to demonstrate compliance per FCC KDB 447498 D01v06.
- 6. Test signal call mode is Manual test cord.
- 7. The EUT was tested for face-held SAR with a 2.5 cm separation distance between the front of the EUT and the outer surface of the planer phantom
- 8. The Body-worn SAR evaluation was performed with the Balt-clip body-worn accessory attached to the DUT and touching the outer surface of the planar phantom.
- 9. The adjusted SAR value was calculated by first scaling the SAR value up by the drift. This value was then scaled up based on the difference of the upper end the tolerance (37.782 dBm) and the measured conducted power. The resultant value is then multiplied by 0.5 to give the SAR value at 50% duty cycle.
- 10. SAR results were scaled to the maximum allowed power to demonstrate compliance per FCC KDB 447498 D01v06. Test Procedures applied in accordance with FCC KDB 643646 D01v01r03.
- 11. Measurement was reduced per KDB 643646 D01v01r03.
- 12. When the SAR for all antennas tested using the default battery is  $\leq$  3.5 W/kg, testing of all other required channels is not necessary.
- 13. When the SAR of an antenna tested on the highest output power using the default battery is >3.5 W/Kg and  $\leq$ 4.0 W/Kg, testing of the immediately adjacent channel(s) is not necessary, but testing of other required channels may still be required.
- 14. When the SAR for all antennas tested using the default battery  $\leq$  4.0 W/kg, test additional batteries using the antenna and channel configuration that resulted in the highest SAR.
- 15. When the SAR of an antenna tested on the highest output power channel using the default battery is > 4.0 W/kg and ≤6.0 W/kg, testing of the required immediately adjacent channel(s) is necessary. For the remaining channels that cannot be excluded, this rule may be applied recursively with respect to the highest output power channel among the remaining channels.
- 16. Based on the SAR measured in the body-worn test sequence with default audio accessory, if the SAR for the antenna, body-worn accessory and battery combination(s) applicable to an audio accessory is/are >4.0 W/kg and <6.0 W/kg, test that audio accessory using the highest body-worn SAR combination (antenna, battery and body-worn accessory) and channel configuration previously identified that is applicable to the audio accessory.
- 17. When the SAR of an antenna tested is > 6.0 W/kg, test that battery and antenna combination with the default body-worn and audio accessory on the required immediately adjacent channels.
- 18. If the SAR measured >7.0 W/kg, test that battery, antenna, body-worn and audio accessory combination on all required channels.

## 13. Measurement Uncertainty

The measured SAR was <1.5 W/Kg for 1g SAR and <3.75 W/Kg For 10g SAR for all frequency bands. Therefore, per KDB Publication 865664 D01v01r04, the extended measurement uncertainty analysis per IEEE1528-2013 was not required.

# 14. SAR Test Equipment

1. The E-field probe was calibrated by SPEAG, by the waveguide technique procedure. Dipole Verification measurement is performed by HCT Lab. before each test. The brain/body simulating material is calibrated by HCT using the DAK-12 to determine the conductivity and permittivity (dielectric constant) of the brain/body-equivalent material.

## 15. Conclusion

The SAR measurement indicates that the EUT complies with the RF radiation exposure limits of the ANSI/IEEE C95.1-2005.

These measurements are taken to simulate the RF effects exposure under worst-case conditions. Precise laboratory measures were taken to assure repeatability of the tests.

The SAR measurement indicates that the EUT complies with the RF radiation exposure limits of the FCC and Industry Canada. These measurements were taken to simulate the RF effects of RF exposure under worst-case conditions. Precise laboratory measures were taken to assure repeatability of the tests. The results and statements relate only to the item(s) tested.

| Input Power      | 100 mW       |
| Liquid Temp:     | 19.6 °C      |
| Test Date:       | 07/15/2019   |

#### DUT: CLA-150

Communication System: UID 0, CW (0); Frequency: 150 MHz;Duty Cycle: 1:1 Medium parameters used: f = 150 MHz;  $\sigma$  = 0.803 S/m;  $\epsilon_r$  = 61.411;  $\rho$  = 1000 kg/m<sup>3</sup> Phantom section: Flat Section

DASY Configuration:

- Probe: EX3DV4 SN3797; ConvF(11.04, 11.04, 11.04); Calibrated: 2018-11-22;
- Sensor-Surface: 1.4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn652; Calibrated: 2019-04-17
- Phantom: ELI v4.0
- Measurement SW: DASY52, Version 52.8 (8);

**150 Mz Verification/Area Scan (9x9x1):** Measurement grid: dx=15mm, dy=15mm Maximum value of SAR (measured) = 0.451 W/kg

150 Wz Verification/Zoom Scan (5x5x7)/Cube 0: Measurement grid: dx=8mm, dy=8mm, dz=5mm Reference Value = 23.78 V/m; Power Drift = -0.10 dB Peak SAR (extrapolated) = 0.645 W/kg SAR(1 g) = 0.366 W/kg; SAR(10 g) = 0.239 W/kg Maximum value of SAR (measured) = 0.524 W/kg

0 dB = 0.451 W/kg = -3.46 dBW/kg

## Attachment 3. – SAR Tissue Characterization

The brain and muscle mixtures consist of a viscous gel using hydrox-ethyl cellulose (HEC) gelling agent and saline solution (see Table 3.1). Preservation with a bacteriacide is added and visual inspection is made to make sure air bubbles are not trapped during the mixing process. The mixture is calibrated to obtain proper dielectric constant (permittivity) and conductivity of the desired tissue. The mixture characterizations used for the brain and muscle tissue simulating liquids are according to the data by C. Gabriel and G. Harts grove.

| Ingredients                      | Frequency (MHz) |        |  |  |  |
|----------------------------------|-----------------|--------|--|--|--|

Composition of the Tissue Equivalent Matter

### Attachment 4. – SAR System Validation

Per FCC KCB 865664 D02v01r02, SAR system validation status should be document to confirm measurement accuracy. The SAR systems (including SAR probes, system components and software versions) used for this device were validated against its performance specifications prior to the SAR measurements. Reference dipoles were used with the required tissue- equivalent media for system validation, according to the procedures outlined in IEEE 1528-2013 and FCC KDB 865664 D01v01r04. Since SAR probe calibrations are frequency dependent, each probe calibration point was validated at a frequency within the valid frequency range of the probe calibration point, using the system that normally operates with the probe for routine SAR measurements and according to the required tissue-equivalent media.

A tabulated summary of the system validation status including the validation date(s), measurement frequencies, SAR probes and tissue dielectric parameters has been included.

| SAR           |       |               | Dro         | bo              |        |            | Dielectric               | Parameters               | CW          | Validatior         | ו                     | Modulat      | ion Vali       | dation |

SAR System Validation Summary 1g

#### Note;

All measurement were performed using probes calibrated for CW signal only. Modulations in the table above represent test configurations for which the measurement system has been validated per FCC KDB Publication 865664 D01v01r04. SAR system were validated for modulated signals with a periodic duty cycle, such as GMSK, or with a high peak to average ratio (>5 dB), such as OFDM according to KDB 865664 D01v01r04.

Swiss Calibration Service

Accreditation No.: SCS 0108

Accredited by the Swiss Accreditation Service (SAS) The Swiss Accreditation Service is one of the signatories to the EA Multilateral Agreement for the recognition of calibration certificates

| Glossary:           |  |
|---------------------|--|
| TSL                 | tissue simulating liquid   |
| NORMx,y,z           | sensitivity in free space  |
| ConvF               | sensitivity in TSL / NORMx,y,z   |
| DCP                 | diode compression point  |
| CF                  | crest factor (1/duty_cycle) of the RF signal   |
| A, B, C, D          | modulation dependent linearization parameters  |
| Polarization $\phi$ | φ rotation around probe axis   |
| Polarization 9      | 9 rotation around an axis that is in the plane normal to probe axis (at measurement center), |
|                     | i.e., 8 = 0 is normal to probe axis  |
| Connector Angle     | information used in DASY system to align probe sensor X to the robot coordinate system       |

#### Calibration is Performed According to the Following Standards:

- a) IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques\*, June 2013
- b) IEC 62209-1, ", "Measurement procedure for the assessment of Specific Absorption Rate (SAR) from handheld and body-mounted devices used next to the ear (frequency range of 300 MHz to 6 GHz)", July 2016
- c) IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz)", March 2010
- d) KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz"

#### Methods Applied and Interpretation of Parameters:

- NORMx, y.z: Assessed for E-field polarization 3 = 0 (f ≤ 900 MHz in TEM-cell; f > 1800 MHz; R22 waveguide). NORMx,y,z are only intermediate values, i.e., the uncertainties of NORMx,y,z does not affect the E2-field uncertainty inside TSL (see below ConvF).
- NORM(f)x,y,z = NORMx,y,z \* frequency\_response (see Frequency Response Chart). This linearization is implemented in DASY4 software versions later than 4.2. The uncertainty of the frequency response is included. in the stated uncertainty of ConvF.
- DCPx,y,z: DCP are numerical linearization parameters assessed based on the data of power sweep with CW signal (no uncertainty required). DCP does not depend on frequency nor media.
- PAR: PAR is the Peak to Average Ratio that is not calibrated but determined based on the signal characteristics
- Ax,y,z; Bx,y,z; Cx,y,z; Dx,y,z; VRx,y,z: A, B, C, D are numerical linearization parameters assessed based on the data of power sweep for specific modulation signal. The parameters do not depend on frequency nor media. VR is the maximum calibration range expressed in RMS voltage across the diode.
- ConvF and Boundary Effect Parameters: Assessed in flat phantom using E-field (or Temperature Transfer Standard for f < 800 MHz) and inside waveguide using analytical field distributions based on power measurements for f > 800 MHz. The same setups are used for assessment of the parameters applied for boundary compensation (alpha, depth) of which typical uncertainty values are given. These parameters are used in DASY4 software to improve probe accuracy close to the boundary. The sensitivity in TSL corresponds to NORMx, y, z \* ConvF whereby the uncertainty corresponds to that given for ConvF. A frequency dependent ConvF is used in DASY version 4.4 and higher which allows extending the validity from ± 50 MHz to ± 100 MHz.
- Spherical isotropy (3D deviation from isotropy); in a field of low gradients realized using a flat phantom exposed by a patch antenna.
- Sensor Offset. The sensor offset corresponds to the offset of virtual measurement center from the probe tip (on probe axis). No tolerance required.
- Connector Angle: The angle is assessed using the information gained by determining the NORMx (no uncertainty required).

Certificate No: EX3-3797\_Nov18

# Probe EX3DV4

## SN:3797

Manufactured: April 5, 2011 Calibrated:

November 22, 2018

Calibrated for DASY/EASY Systems (Note: non-compatible with DASY2 system!)

Certificate No: EX3-3797\_Nov18

Page 3 of 39

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.

Certificate No: EX3-3797\_Nov18

Page 4 of 39

<sup>&</sup>lt;sup>6</sup> The uncertainties of Norm X,Y,Z do not affect the E<sup>L</sup>-field uncertainty inside TSL (see Pages 5 and 6).
<sup>8</sup> Numerical linearization parameter: uncertainty not required.
<sup>9</sup> Uncertainty is determined using the max, deviation from linear response applying rectangular distribution and is expressed for the square of the Pade of the State of the Stat field value.

Calibration Parameter Determined in Head Tissue Simulating Media

<sup>C</sup> Frequency validity above 300 MHz of ± 100 MHz only applies for DASY v4.4 and higher (see Page 2), else it is restricted to ± 50 MHz. The uncertainty is the RSS of the ConvF uncertainty at calibration frequency and the uncertainty for the indicated frequency band. Frequency validity below 300 MHz is ± 10, 25, 40, 50 and 70 MHz for ConvF assessments at 30, 64, 128, 150 and 220 MHz respectively. Above 5 GHz frequency validity can be extended to ± 100 MHz.
\* At frequencies below 3 GHz, the validity of tissue parameters (s and e) can be relaxed to ± 10% if liquid compensation formula is applied to measured SAR values. At frequencies above 3 GHz, the validity of tissue parameters (s and e) is restricted to ± 5%. The uncertainty is the RSS of the ConvF uncertainty for indicated target tissue parameters.
\* At frequencies below 10 GHz, the validity of tissue parameters (s and e) can be relaxed to ± 10% if liquid compensation formula is applied to measured SAR values. At frequencies above 3 GHz, the validity of tissue parameters (s and e) are the remaining deviation due to the boundary effect after compensation is always less than ± 1% for frequencies below 3 GHz and below ± 2% for frequencies between 3-6 GHz at any distance larger than half the probe tip diameter from the boundary.

Calibration Parameter Determined in Body Tissue Simulating Media

<sup>D</sup> Frequency validity above 300 MHz of ± 100 MHz only applies for DASY v4.4 and higher (see Page 2), else it is restricted to ± 50 MHz. The uncertainty is the RSS of the ConvF uncertainty at calibration frequency and the uncertainty for the indicated frequency band. Frequency validity below 300 MHz is ± 10, 25, 40, 50 and 70 MHz for ConvF assessments at 30, 64, 128, 150 and 220 MHz respectively. Above 5 GHz frequency validity and be extended to ± 110 MHz.
<sup>a</sup> At frequencies below 3 GHz, the validity of tissue parameters (s and o) can be relaxed to ± 10% if liquid compensation formula is applied to measured SAR values. At frequencies below 3 GHz, the validity of tissue parameters (s and o) is restricted to ± 5%. The uncertainty is the RSS of the ConvF uncertainty for indicated target issue parameters.
<sup>a</sup> Alpha/Depth are determined during calibration. SPEAG warrants that the remaining deviation due to the boundary effect after compensation is always less than ± 1% for frequencies below 3 GHz and below ± 2% for frequencies between 3-6 GHz at any distance larger than half the probe tip diameter from the boundary.

Calibration Laboratory of Schmid & Partner Engineering AG Zeughausstrasse 43, 8004 Zurich, Switzerland

S Schweizerischer Kalibrierdienst C Service suisse d'étaionnage Servizio svizzero di taratura

S Swiss Calibration Service

Swiss Calibration Service

Accreditation No.: SCS 0108

Accredited by the Swiss Accreditation Service (SAS) The Swiss Accreditation Service is one of the signatories to the EA Multilateral Agreement for the recognition of calibration certificates

### Glossary:

| TSL   | tissue simulating liquid        |
|-------|---------------------------------|
| ConvF | sensitivity in TSL / NORM x,y,z |
| N/A   | not applicable or not measured  |

#### Calibration is Performed According to the Following Standards:

- a) IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", June 2013
- b) IEC 62209-1, "Measurement procedure for the assessment of Specific Absorption Rate (SAR) from hand-held and body-mounted devices used next to the ear (frequency range of 300 MHz to 6 GHz)", July 2016
- c) IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz)", March 2010
- d) KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz"

#### Additional Documentation:

e) DASY4/5 System Handbook

### Methods Applied and Interpretation of Parameters:

- Measurement Conditions: Further details are available from the Validation Report at the end
  of the certificate. All figures stated in the certificate are valid at the frequency indicated.
- Antenna Parameters with TSL: The source is mounted in a touch configuration below the center marking of the flat phantom.
- Return Loss: This parameter is measured with the source positioned under the liquid filled phantom (as described in the measurement condition clause). The Return Loss ensures low reflected power. No uncertainty required.
- SAR measured: SAR measured at the stated antenna input power.
- SAR normalized: SAR as measured, normalized to an input power of 1 W at the antenna connector.
- SAR for nominal TSL parameters: The measured TSL parameters are used to calculate the nominal SAR result.

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.

Certificate No: CLA150-4014\_Sep18

## **Measurement Conditions**

DASY system configuration, as far as not given on page 1.

| DASY Version         | DASY5                        | V52.10.1                         |
|----------------------|------------------------------|----------------------------------|
| Extrapolation        | Advanced Extrapolation       |                                  |
| Phantom              | ELI4 Flat Phantom            | Shell thickness: 2 ± 0.2 mm      |
| EUT Positioning      | Touch Position               |                                  |
| Zoom Scan Resolution | dx, dy = 4.0 mm, dz = 1.4 mm | Graded Ratio = 1.4 (Z direction) |
| Frequency            | 150 MHz ± 1 MHz              |                                  |

## Head TSL parameters

The following parameters and calculations were applied.

|   | Temperature     | Permittivity    | Conductivity     |
|---|-----------------|-----------------|------------------|
| Nominal Head TSL parameters             | 22.0 °C         | 52.3            | 0.76 mho/m       |
| Measured Head TSL parameters            | (22.0 ± 0.2) °C | 50.6 ± 6 %      | 0.77 mho/m ± 6 % |
| Head TSL temperature change during test | < 0.5 °C        | - <del></del> - |                  |

## SAR result with Head TSL

| SAR averaged over 1 cm <sup>3</sup> (1 g) of Head TSL | Condition        |                          |
|---|------------------|--------------------------|
| SAR measured  | 1 W input power  | 3.77 W/kg                |
| SAR for nominal Head TSL parameters                   | normalized to 1W | 3.71 W/kg ± 18.4 % (k=2) |

| SAR averaged over 10 cm <sup>3</sup> (10 g) of Head TSL | condition        |                          |
|---|------------------|--------------------------|
| SAR measured  | 1 W input power  | 2.52 W/kg                |
| SAR for nominal Head TSL parameters                     | normalized to 1W | 2.48 W/kg ± 18.0 % (k=2) |

## **Body TSL parameters**

The following parameters and calculations were applied.

|   | Temperature     | Permittivity | Conductivity     |
|---|-----------------|--------------|------------------|
| Nominal Body TSL parameters             | 22.0 °C         | 61.9         | 0.80 mho/m       |
| Measured Body TSL parameters            | (22.0 ± 0.2) *C | 63.3 ± 6 %   | 0.83 mho/m ± 6 % |
| Body TSL temperature change during test | < 0.5 °C        |              |                  |

## SAR result with Body TSL

| SAR averaged over 1 cm <sup>3</sup> (1 g) of Body TSL                   | Condition                    |                          |
|---|------------------------------|--------------------------|
| SAR measured  | 1 W input power              | 3.93 W/kg                |
| SAR for nominal Body TSL parameters                                     | normalized to 1W             | 3.84 W/kg ± 18.4 % (k=2) |
|   |                              |                          |
| SAR averaged over 10 cm <sup>3</sup> (10 g) of Body TSL                 | condition                    |                          |
| SAR averaged over 10 cm <sup>3</sup> (10 g) of Body TSL<br>SAR measured | condition<br>1 W input power | 2.61 W/kg                |

Certificate No: CLA150-4014\_Sep18

## Appendix (Additional assessments outside the scope of SCS 0108)

## Antenna Parameters with Head TSL

| Impedance, transformed to feed point | 45.7 Ω + 5.1 jΩ |  |
|--------------------------------------|-----------------|--|
| Return Loss                          | - 23.2 dB       |  |

## Antenna Parameters with Body TSL

| Impedance, transformed to feed point | 51.0 Ω + 5.7 jΩ |  |
|--------------------------------------|-----------------|--|
| Return Loss                          | - 24.9 dB       |  |

# Additional EUT Data

| Manufactured by | SPEAG         |  |

## **DASY5 Validation Report for Head TSL**

Date: 21.09.2018

Test Laboratory: SPEAG, Zurich, Switzerland

#### DUT: CLA150; Type: CLA150; Serial: CLA150 - SN: 4014

Communication System: UID 0 - CW; Frequency: 150 MHz Medium parameters used: f = 150 MHz;  $\sigma$  = 0.77 S/m;  $\epsilon_r$  = 50.6;  $\rho$  = 1000 kg/m<sup>3</sup> Phantom section: Flat Section Measurement Standard: DASY5 (IEEE/IEC/ANSI C63.19-2011)

DASY52 Configuration:

- Probe: EX3DV4 SN3877; ConvF(12.12, 12.12, 12.12) @ 150 MHz; Calibrated: 30.12.2017
- Sensor-Surface: 1.4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn654; Calibrated: 05.07.2018
- Phantom: ELI v4.0; Type: QDOVA001BB; Serial: TP:1003
- DASY52 52.10.1(1476); SEMCAD X 14.6.11(7439)

# CLA Calibration for HSL-LF Tissue/CLA150, touch configuration, Pin=1W/Area Scan

(81x81x1): Interpolated grid: dx=1.500 mm, dy=1.500 mm Maximum value of SAR (interpolated) = 5.31 W/kg

CLA Calibration for HSL-LF Tissue/CLA150, touch configuration, Pin=1W/Zoom Scan, dist=1.4mm (8x10x7)/Cube 0: Measurement grid: dx=4mm, dy=4mm, dz=1.4mm Reference Value = 82.65 V/m; Power Drift = -0.04 dB Peak SAR (extrapolated) = 7.04 W/kg SAR(1 g) = 3.77 W/kg; SAR(10 g) = 2.52 W/kg Maximum value of SAR (measured) = 5.23 W/kg

0 dB = 5.31 W/kg = 7.25 dBW/kg

Certificate No: CLA150-4014\_Sep18

## **DASY5 Validation Report for Body TSL**

Date: 26.09.2018

Test Laboratory: SPEAG, Zurich, Switzerland

### DUT: CLA150; Type: CLA150; Serial: CLA150 - SN: 4014

Communication System: UID 0 - CW; Frequency: 150 MHz Medium parameters used: f = 150 MHz;  $\sigma$  = 0.83 S/m;  $\varepsilon_r$  = 63.3;  $\rho$  = 1000 kg/m<sup>3</sup> Phantom section: Flat Section Measurement Standard: DASY5 (IEEE/IEC/ANSI C63,19-2011)

DASY52 Configuration:

- Probe: EX3DV4 SN3877; ConvF(11.57, 11.57, 11.57) @ 150 MHz; Calibrated: 30.12.2017
- Sensor-Surface: 1.4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn654; Calibrated: 05.07.2018
- Phantom: ELI v4.0; Type: QDOVA001BB; Serial: TP:1003
- DASY52 52.10.1(1476); SEMCAD X 14.6.11(7439)

## CLA Calibration for MSL-LF Tissue/CLA150, touch configuration, Pin=1W/Area Scan

(81x81x1): Interpolated grid: dx=1.500 mm, dy=1.500 mm Maximum value of SAR (interpolated) = 5.53 W/kg

CLA Calibration for MSL-LF Tissue/CLA150, touch configuration, Pin=1W/Zoom Scan, dist=1.4mm (8x10x7)/Cube 0: Measurement grid: dx=4mm, dy=4mm, dz=1.4mm Reference Value = 77.76 V/m; Power Drift = 0.03 dB Peak SAR (extrapolated) = 7.39 W/kg SAR(1 g) = 3.93 W/kg; SAR(10 g) = 2.61 W/kg Maximum value of SAR (measured) = 5.51 W/kg

0 dB = 5.53 W/kg = 7.43 dBW/kg

Certificate No: CLA150-4014\_Sep18
