## GENERAL REMARKS

The attached report shall not be reproduced except in full without the written permission of Timco Engineering Inc.

## Summary

The device under test does:

fulfill the general approval requirements as identified in this test report

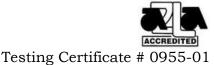

not fulfill the general approval requirements as identified in this test report

This is a request for a Class II Permissive change. With the change, the device becomes model number FT-7900R. Radiated emissions testing was completed and there is no degradation from previously reported data.

### Attestations

This equipment has been tested in accordance with the standards identified in this test report. To the best of my knowledge and belief, these tests were performed using the measurement procedures described in this report.

All instrumentation and accessories used to test products for compliance to the indicated standards are calibrated regularly in accordance with ISO 17025 requirements.

I attest that the necessary measurements were made, under my supervision, at:

Timco Engineering Inc. 849 NW State Road 45 Newberry, Fl 32669

Mario de Aranzeta C.E.T. Compliance Engineer/ Lab. Supervisor

**Date:** 5/5/2009

## **GENERAL INFORMATION**

The test results relate only to the items tested.				
<b>DUT Description</b>	SCANNING RX

### **TEST PROCEDURE**

**General:** This report shall NOT be reproduced except in full without the written approval of TIMCO ENGINEERING, INC.

**Radiation Interference:** The test procedure used was ANSI Standard C63.4-2003 using a spectrum analyzer with a pre-selector. The bandwidth of the spectrum analyzer was 100 kHz with an appropriate sweep speed. The analyzer was calibrated in dB above a microvolt at the output of the antenna. The video bandwidth was always greater than or equal to the RBW.

**Formula Of Conversion Factors:** The Field Strength at 3m was established by adding the meter reading of the spectrum analyzer (which is set to read in units of dBuV) to the antenna correction factor supplied by the antenna manufacturer. The antenna correction factors are stated in terms of dB. The gain of the Preselector was accounted for in the Spectrum Analyzer Meter Reading.

Example:				
Freq (MHz)	Meter Reading	+ ACF	+CL	= FS
33	20 dBuV	+ 10.36 dB/m	+0.40 dB	=30.36 dBuV/m@3m

**ANSI C63.4-2003 Section 10.1.7 Measurement Procedures:** The unit under test was placed on a table 80 cm high and with dimensions of 1mby 1.5m. The table used for radiated measurements is capable of continuous rotation. When an emission was found, the table was rotated to produce the maximum signal strength. At this point, the antenna was raised and lowered from 1m to 4m. The antenna was placed in both the horizontal and verticals planes.

If powerline conducted testing was required for this device, the situation was similar for the conducted measurement except that the table did not rotate. The EUT was setup as described in ANSI C63.4-2003 with the EUT 40 cm from the vertical ground wall.

## **RADIATED SPURIOUS EMISSIONS**

**Rules Part No.:** 15.109

#### **Requirements:**

Frequency	Limits			
30 - 88	40.0 dB $\mu$ V/m measured @ 3 meters			
80 - 216	43.5 dB $\mu$ V/m measured @ 3 meters			
216 - 960	46.0 dBµV/m measured @ 3 meters			
Above 960	54.0 dB $\mu$ V/m measured @ 3 meters			

**Test Procedure:** The procedure used was ANSI C63.4-2003. The frequency was scanned from 30 MHz to 1.0 GHz. When an emission was found, the table was rotated to produce the maximum signal strength. The DUT was measured in three (3) orthogonal planes.

#### **Test Data:**

Tuned	Emission	Meter	Ant.	Coax	Correction	Field	Margin
Frequency	Frequency	Reading	Polarity	Loss	Factor	Strength	dB
MHz	MHz	dBuV		dB	dB	dBuV/m

## **POWER LINE CONDUCTED INTERFERENCE**

Rules Part No.: Part 15.107

Requirements:

•

Frequency (MHz)	Quasi Peak Limits (dBuv)	Average Limits (dBuV)
0.15 – 0.5	66 – 56	56 – 46
0.5 – 5.0	56	46
5.0 – 30	60	50

**Test Procedure**: ANSI Standard C63.4-2003. The spectrum was scanned from 0.15 to 30 MHz.

Test Data: Not applicable.
