# 1. Description of Equipment Under Test (EUT)

**Applicant :**

**Giant Electronics Ltd.**

7/F., Elite Industrial Bldg., 135-137 Hoi Bun Road, Kwun Tong, Kowloon, Hong Kong

**EUT Type :** Two-Way Radio with GMRS and FRS  
**Trade Name :** Motorola  
**Model Name :** FV600  
**Battery Type :** Ni-MH Battery ( 3.6V , 600mAh )  
 ALKALINE Battery \* 3 ( 1.5V AA )  
**FCC ID :** K7GFV500  
**Test Device :** Production Unit  
**Tx Frequency :** 462.5500 - 462.7250 MHz ( GMRS )  
 467.5625 – 467.7125 MHz ( FRS )  
**Max. RF Output Power :** 0.33 W ERP GMRS (25.1 dBm )  
 0.18 W ERP FRS (22.5 dBm )  
**Max. SAR Measurement :** 0.511 W/kg GMRS Face SAR (50% Duty Cycle)  
 0.314 W/kg GMRS Body SAR (50% Duty Cycle)  
 0.446 W/kg GMRS Body w/o Belt-Clip SAR (50% Duty Cycle)  
 0.387 W/kg FRS Face SAR (50% Duty Cycle)  
 0.272 W/kg FRS Body SAR (50% Duty Cycle)  
 0.307 W/kg FRS Body w/o Belt-Clip SAR (50% Duty Cycle)  
 (Condition: 50% Duty Cycle and positive power drift)  
**Antenna Type :** Fixed Type (Antenna Gain = -3dBi)  
**Device Category :** Portable  
**RF Exposure Environment :** General Population / Uncontrolled  
**Battery Option :** Standard  
**Application Type :** Certification

This wireless portable device has been shown to be capable of compliance for localized specific absorption rate (SAR) for uncontrolled environment / general population exposure limits specified in Standard C95.1-1999 and had been tested in accordance with the measurement procedures specified in IEEE Std. 1528-2003.

## 2. Other Accessories

There is headset and Belt-clip will be an accessory with EUT.

Front view

Back view

Figure 2. headset and Belt-clip

## 3. Introduction

The A Test Lab Techno. Corp. RF Testing Laboratory has performed measurements of the maximum potential exposure to the user of **Giant Electronics Ltd. Trade Name : Motorola Model(s) : FV600**. The test procedures, as described in American National Standards, Institute C95.1 - 1999 [ 1 ] , FCC/OET Bulletin 65 Supplement C [July 2001] were employed and they specify the maximum exposure limit of 1.6mW/g as averaged over any 1 gram of tissue for portable devices being used within 20cm between user and EUT in the uncontrolled environment. A description of the product and operating configuration, detailed summary of the test results, methodology and procedures used in the equipment used are included within this test report.

## **4. SAR Definition**

Specific Absorption Rate (SAR) is defined as the time derivative (rate) of the incremental energy ( $dw$ ) absorbed by (dissipated in) an incremental mass ( $dm$ ) contained in a volume element ( $dv$ ) of a given density ( $\rho$ ). It is also defined as the rate of RF energy absorption per unit mass at a point in an absorbing body (see Figure 2).

$$\text{SAR} = \frac{d}{dt} \left( \frac{dw}{dm} \right) = \frac{d}{dt} \left( \frac{dw}{\rho dv} \right)$$

**Figure 4. SAR Mathematical Equation**

**SAR is expressed in units of Watts per kilogram (W/kg)**

$$\text{SAR} = \frac{\sigma E^2}{\rho}$$

Where :

$\sigma$  = conductivity of the tissue (S/m)

$\rho$  = mass density of the tissue (kg/m<sup>3</sup>)

$E$  = RMS electric field strength (V/m)

**\* Note :**

The primary factors that control rate of energy absorption were found to be the wavelength of the incident field in relations to the dimensions and geometry of the irradiated organism, the orientation of the organism in relation to the polarity of field vectors, the presence of reflecting surfaces, and whether conductive contact is made by the organism with a ground plane [ 2 ]

## **5. SAR Measurement Setup**

These measurements were performed with the automated near-field scanning system DASY4 from Schmid & Partner Engineering AG (SPEAG). The system is based on a high precision robot (working range greater than 0.9m) which positions the probes with a positional repeatability of better than  $\pm 0.025\text{mm}$ . Special E- and H-field probes have been developed for measurements close to material discontinuity, the sensors of which are directly loaded with a Schottky diode and connected via highly resistive lines (length = 300mm) to the data acquisition unit.

A cell controller system contains the power supply, robot controller, teach pendant (Joystick), and remote control, is used to drive the robot motors. The Measurement Server is based on a PC/104 CPU board with a 166MHz low-power Pentium, 32MB chipdisk and 64MB RAM. The necessary circuits for communication with either the DAE3 electronic box as well as the 16-bit AD-converter system for optical detection and digital I/O interface are contained on the DASY4 I/O-board, which is directly connected to the PC/104 bus of the CPU board. The PC consists of the Intel Pentium 4 2.4GHz computer with Windows2000 system and SAR Measurement Software DASY4, Post Processor SEMCAD, monitor, mouse, and keyboard. The Staubli Robot is connected to the cell controller to allow software manipulation of the robot. A data acquisition electronic (DAE) circuit performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection...etc. is connected to the Electro-optical converter (EOC). The EOC performs the conversion from the optical into digital electric signal of the DAE and transfers data to the Measurement Server.

**Figure 5. SAR Lab Test Measurement Setup**

The DAE3 consists of a highly sensitive electrometer-grade preamplifier with auto-zeroing, a channel and gain-switching multiplexer, a fast 16 bit AD-converter and a command decoder and control logic unit. Transmission to the PC-card is accomplished through an optical downlink for data and status information and an optical uplink for commands and clock lines. The mechanical probe mounting device includes two different sensor systems for frontal and sidewise probe contacts. They are also used for mechanical surface detection and probe collision detection. The robot uses its own controller with a built in VME-bus computer. The system is described in detail in [ 3 ] .

## **6. System Components**

### **6.1 DASY4 E-Field Probe System**

The SAR measurements were conducted with the dosimetric probe ET3DV6 (manufactured by SPEAG), designed in the classical triangular configuration [ 3 ] and optimized for dosimetric evaluation. The probe is constructed using the thick film technique; with printed resistive lines on ceramic substrates. The probe is equipped with an optical multi-fiber line ending at the front of the probe tip. It is connected to the EOC box on the robot arm and provides an automatic detection of the phantom surface. Half of the fibers are connected to a pulsed infrared transmitter, the other half to a synchronized receiver. As the probe approaches the surface, the reflection from the surface produces a coupling from the transmitting to the receiving fibers. This reflection increases first during the approach, reaches maximum and then decreases. If the probe is flatly touching the surface, the coupling is zero. The distance of the coupling maximum to the surface is independent of the surface reflectivity and largely independent of the surface to probe angle. The DASY4 software reads the reflection during a software approach and looks for the maximum using a 2nd order fitting. The approach is stopped when reaching the maximum.

### 6.1.1 ET3DV6 E-Field Probe Specification

<b>Construction</b>	Symmetrical design with triangular core Built-in optical fiber for surface detection System (ET3DV6 only) Built-in shielding against static charges PEEK enclosure material (resistant to organic solvents, e.q., glycol)
<b>Calibration</b>	In air from 10 MHz to 2.5 GHz In head and body simulating tissue at frequencies of 450MHz, 900MHz, 1.8GHz and 2.45GHz (accuracy $\pm 8\%$ ) Calibration for other liquids and frequencies upon request
<b>Frequency</b>	10 MHz to > 6 GHz; Linearity: $\pm 0.2$ dB (30 MHz to 3 GHz)
<b>Directivity</b>	$\pm 0.2$ dB in head tissue (rotation around probe axis) $\pm 0.4$ dB in head tissue (rotation normal probe axis)
<b>Dynamic Range</b>	5 $\mu$ W/g to > 100mW/g; Linearity: $\pm 0.2$ dB
<b>Surface Detection</b>	$\pm 0.2$ mm repeatability in air and clear liquids over diffuse reflecting surface(ET3DV6 only)
<b>Dimensions</b>	Overall length: 330mm Tip length: 16mm Body diameter: 12mm Tip diameter: 6.8mm Distance from probe tip to dipole centers: 2.7mm
<b>Application</b>	General dosimetry up to 3GHz Compliance tests of mobile phones Fast automatic scanning in arbitrary phantoms

**Figure 6.**  
**ET3DV6 E-field Probe**

**Figure 7.**  
**Probe setup on robot**

### 6.1.2 ET3DV6 E-Field Probe Calibration

Each probe is calibrated according to a dosimetric assessment procedure described in [ 4 ] with accuracy better than ± 10%. The spherical isotropy was evaluated with the procedure described in [ 5 ] and found to be better than ± 0.25dB. The sensitivity parameters (NormX, NormY, and NormZ), the diode compression parameter (DCP) and the conversion factor (ConvF) of the probe are tested.

The free space E-field from amplified probe outputs is determined in a test chamber. This is performed in a TEM cell for frequencies bellow 1GHz, and in a wave guide above 1GHz for free space. For the free space calibration, the probe is placed in the volumetric center of the cavity and at the proper orientation with the field. The probe is then rotated 360 degrees.

E-field temperature correlation calibration is performed in a flat phantom filled with the appropriate simulated head tissue. The measured free space E-field in the medium correlates to temperature rise in a dielectric medium. For temperature correlation calibration a RF transparent thermistor-based temperature probe is used in conjunction with the E-field probe.

$$SAR = C \frac{\Delta T}{\Delta t}$$

Where :

$\Delta t$  = Exposure time (30 seconds),

C = Heat capacity of tissue (head or body),

$\Delta T$  = Temperature increase due to RF exposure.

Or

$$SAR = \frac{|E|^2 \sigma}{\rho}$$

Where :

$\sigma$  = Simulated tissue conductivity,

$\rho$  = Tissue density (kg/m<sup>3</sup>).

## 6.2 Data Acquisition Electronic (DAE) System

### Cell Controller

Processor : Intel Pentium 4

Clock Speed : 2.4GHz

Operating System : Windows 2000 Professional

### Data Converter

Features : Signal Amplifier, multiplexer, A/D converter, and control logic

Software : DASY4 v4.4 (Build 3) & SEMCAD v1.8 (Build 180)

Connecting Lines : Optical downlink for data and status info

Optical uplink for commands and clock

### **6.3 Robot**

Positioner : Stäubli Unimation Corp. Robot Model: RX90L

Repeatability :  $\pm 0.025$  mm

No. of Axis : 6

### **6.4 Measurement Server**

Processor : PC/104 with a 166MHz low-power Pentium

I/O-board : Link to DAE3

16-bit A/D converter for surface detection system

Digital I/O interface

Serial link to robot

Direct emergency stop output for robot

### **6.5 Device Holder for Transmitters**

In combination with the SAM Twin Phantom V4.0, the Mounting Device (POM) enables the rotation of the mounted transmitter in spherical coordinates whereby the rotation points is the ear opening. The devices can be easily, accurately, and repeat ably positioned according to the IEEE SCC34-SC2 and CENELEC specifications. The device holder can be locked at different phantom locations (left head, right head, and flat phantom).

**\*Note :** A simulating human hand is not used due to the complex anatomical and geometrical structure of the hand that may produced infinite number of configurations [ 6 ] . To produce the worst-case condition (the hand absorbs antenna output power), the hand is omitted during the tests.

Larger DUT cannot be tested using this device holder. Instead a support of bigger polystyrene cubes and thin polystyrene plates is used to position the DUT in all relevant positions to find and measure spots with maximum SAR values. Therefore those devices are normally only tested at the flat part of the SAM.

**Figure 8. Device Holder**

## **6.6 Phantom - SAM v4.0**

The shell corresponds to the specifications of the Specific Anthropomorphic Mannequin (SAM) phantom defined in IEEE 1528-2003, CENELEC 50361 and IEC 62209. It enables the dosimetric evaluation of left and right hand phone usage as well as body mounted usage at the flat phantom region. A cover prevents evaporation of the liquid. Reference markings on the phantom allow the complete setup of all predefined phantom positions and measurement grids by manually teaching three points with the robot.

**Figure 9. SAM Twin Phantom**

<b>Shell Thickness</b>	2 ± 0.2 mm
<b>Filling Volume</b>	Approx. 25 liters
<b>Dimensions</b>	810×1000×500 mm (H×L×W)

**Table 1. Specification of SAM v4.0**

## **6.7 Data Storage and Evaluation**

### **6.7.1 Data Storage**

The DASY4 software stores the assessed data from the data acquisition electronics as raw data (in microvolt readings from the probe sensors), together with all the necessary software parameters for the data evaluation (probe calibration data, liquid parameters and device frequency and modulation data) in measurement files with the extension .DA4. The postprocessing software evaluates the desired unit and format for output each time the data is visualized or exported. This allows verification of the complete software setup even after the measurement and allows correction of erroneous parameter settings. For example, if a measurement has been performed with an incorrect crest factor parameter in the device setup, the parameter can be corrected afterwards and the data can be reevaluated.

**6.7.2 Data Evaluation**

The DASY4 postprocessing software (SEMCAD) automatically executes the following procedures to calculate the field units from the microvolt readings at the probe connector. The parameters used in the evaluation are stored in the configuration modules of the software :

- Probe parameters :**
- Sensitivity Normi, ai0, ai1, ai2
  - Conversion factor ConvFi
  - Diode compression point dcp<sub>i</sub>
- Device parameters :**
- Frequency f
  - Crest factor cf
- Media parameters :**
- Conductivity  $\sigma$
  - Density  $\rho$

These parameters must be set correctly in the software. They can be found in the component documents or they can be imported into the software from the configuration files issued for the DASY components. In the direct measuring mode of the multimeter option, the parameters of the actual system setup are used. In the scan visualization and export modes, the parameters stored in the corresponding document files are used.

The first step of the evaluation is a linearization of the filtered input signal to account for the compression characteristics of the detector diode. The compensation depends on the input signal, the diode type and the DC-transmission factor from the diode to the evaluation electronics. If the exciting field is pulsed, the crest factor of the signal must be known to correctly compensate for peak power. The formula for each channel can be given as :

$$V_i = U_i + U_i^2 \cdot \frac{cf}{dcp_i}$$

- with
- $V_i$  = compensated signal of channel  $i$  ( $i = x, y, z$ )
  - $U_i$  = input signal of channel  $i$  ( $i = x, y, z$ )
  - $cf$  = crest factor of exciting field (DASY parameter)
  - $dcp_i$  = diode compression point (DASY parameter)

From the compensated input signals the primary field data for each channel can be evaluated :

**E-field probes :**

$$E_i = \sqrt{\frac{V_i}{Norm_i \cdot ConvF}}$$

**H-field probes :**

$$H_i = \sqrt{V_i} \cdot \frac{a_{i0} + a_{i1}f + a_{i2}f^2}{f}$$

with  $V_i$  = compensated signal of channel  $i$  ( $i = x, y, z$ )

$Norm_i$  = sensor sensitivity of channel  $i$  ( $i = x, y, z$ )

$\mu V/(V/m)^2$  for E-field Probes

$ConvF$  = sensitivity enhancement in solution

$a_{ij}$  = sensor sensitivity factors for H-field probes

$f$  = carrier frequency [GHz]

$E_i$  = electric field strength of channel  $i$  in V/m

$Hi$  = magnetic field strength of channel  $i$  in A/m

The RSS value of the field components gives the total field strength (Hermitian magnitude) :

$$E_{tot} = \sqrt{E_x^2 + E_y^2 + E_z^2}$$

The primary field data are used to calculate the derived field units.

$$SAR = E_{tot}^2 \cdot \frac{\sigma}{\rho \cdot 1000}$$

with  $SAR$  = local specific absorption rate in mW/g

$E_{tot}$  = total field strength in V/m

$\sigma$  = conductivity in [mho/m] or [Siemens/m]

$\rho$  = equivalent tissue density in  $g/cm^3$

**\* Note :** that the density is set to 1, to account for actual head tissue density rather than the density of the tissue simulating liquid.

The power flow density is calculated assuming the excitation field to be a free space field.

$$P_{pwe} = \frac{E_{tot}^2}{3770} \quad \text{or} \quad P_{pwe} = \frac{H_{tot}^2}{37.7}$$

with  $P_{pwe}$  = equivalent power density of a plane wave in  $mW/cm^2$

$E_{tot}$  = total electric field strength in V/m

$H_{tot}$  = total magnetic field strength in A/m

## **7. Test Equipment List**

## **8. Tissue Simulating Liquids**

The Head and body mixtures consist of a viscous gel using hydroxethylcellullose (HEC) gelling agent and saline solution. Preservation with a bactericide is added and visual inspection is made to ensure air bubbles are not trapped during the mixing process. The mixture is calibrated to obtain proper dielectric constant (permittivity) and conductivity of the tissue.

The dielectric parameters of the liquids were verified prior to the SAR evaluation using an 85070C Dielectric Probe Kit and an 8720ES Network Analyzer.

INGREDIENT	FREQUENCY	
	HSL450 - Head (400-500MHz)	MSL450 - Body (400-500MHz)
Water	38.91 %	46.21 %
HEC	0.25 %	0.18 %
Sugar	56.93 %	51.17 %
Preventol	0.12 %	0.08 %
Salt	3.79 %	2.34 %
Glycol monobutyl	0 %	0 %
Dielectric Parameters at 22°C	f = 450 MHz  $\epsilon_r = 43.5, \sigma = 0.87 \text{ S/m}$	f = 450 MHz  $\epsilon_r = 56.7, \sigma = 0.94 \text{ S/m}$

**Table 3. Recipes for Head & Body Tissue Simulating Liquids**

### **IEEE SCC-34/SC-2 in 1528 recommended Tissue Dielectric Parameters**

The head tissue dielectric parameters recommended by the IEEE SCC-34/SC-2 in 1528 have been incorporated in the following table. These head parameters are derived from planar layer models simulating the highest expected SAR for the dielectric properties and tissue thickness variations in human head. Other head and body tissue parameters that have not been specified in 1528 are derived from the tissue dielectric parameters computed from the 4-Cole-Cole equation and extrapolated according to the head parameter specified in 1528.

Target Frequency (MHz)	Head		Body	
	$\epsilon_r$	$\sigma$ (S/m)	$\epsilon_r$	$\sigma$ (S/m)
150	52.3	0.76	61.9	0.80
300	45.3	0.87	58.2	0.92
450	43.5	0.87	56.7	0.94
835	41.5	0.90	55.2	0.97
900	41.5	0.97	55.0	1.05
915	41.5	0.98	55.0	1.06
1450	40.5	1.20	54.0	1.30
1610	40.3	1.29	53.8	1.40
1800 - 2000	40.0	1.40	53.3	1.52
2450	39.2	1.80	52.7	1.95
3000	38.5	2.40	52.0	2.73
5800	35.3	5.27	48.2	6.00

(  $\epsilon_r$  = relative permittivity,  $\sigma$  = conductivity and  $\rho$  = 1000 kg/m<sup>3</sup> )

Table 4. Tissue dielectric parameters for head and body phantoms

## 8.1 Liquid Confirmation

### 8.1.1 Parameters

Liquid Verify								
Ambient Temperature : 22±2 °C ; Relative Humidity : < 60%								
Liquid Type	Frequency	Temp (°C)	Parameters	Target Value	Measured Value	Deviation (%)	Limit (%)	Measured Date
450MHz Head	450MHz	22.0	$\epsilon_r$	43.5	<b>44.77</b>	2.76	±5 %	Dec. 13 , 2005

Table 5. Measured Tissue dielectric parameters for head and body phantoms

### 8.1.2 Liquid Depth

The liquid level was during measurement 15cm  $\pm$ 0.5cm.

Figure 10. Head-Tissue-Simulating-Liquid 450MHz

Figure 11. Body-Tissue-Simulating-Liquid 450MHz

## 9. Measurement Process

### 9.1 Device and Test Conditions

The Test Device was provided by **Giant Electronics Ltd.** for this evaluation. The spatial peak SAR values were assessed for the lowest, middle and highest channels defined by GMRS ( Ch4 = 462.6375MHz , Ch15 = 462.5500MHz , Ch22 = 462.7250MHz ) / FRS ( Ch8 = 467.5625MHz , Ch11 = 467.6375MHz , Ch14 = 467.7125MHz ) systems. Battery and accessories shall be those specified by the manufacturer. The battery shall be fully charged before each measurement and there shall be no external connections.

## **9.2 System Performance Check**

### **9.2.1 Symmetric Dipoles for System Validation**

<b>Construction</b>	Symmetrical dipole with 1/4 balun enables measurement of feed point impedance with NWA matched for use near flat phantoms filled with head simulating solutions Includes distance holder and tripod adaptor Calibration Calibrated SAR value for specified position and input power at the flat phantom in head simulating solutions.
<b>Frequency</b>	450, 900, 1800, 2450MHz
<b>Return Loss</b>	> 20 dB at specified validation position
<b>Power Capability</b>	> 100 W (f < 1GHz); > 40 W (f > 1GHz)
<b>Options</b>	Dipoles for other frequencies or solutions and other calibration conditions are available upon request
<b>Dimensions</b>	D450V2 : dipole length 270 mm; overall height 330 mm D900V2 : dipole length 149 mm; overall height 330 mm D1800V2 : dipole length 72 mm; overall height 300 mm D2450V2 : dipole length 51.5 mm; overall height 300 mm

**Figure 12. Validation Kit**

### 9.2.2 Validation

Prior to the assessment, the system validation kit was used to test whether the system was operating within its specifications of  $\pm 10\%$ . The validation was performed at 450MHz.

Validation kit		Mixture Type		SAR <sub>1g</sub> [mW/g]	SAR <sub>10g</sub> [mW/g]	Date of Calibration	
D450V2-SN265		Head		5.025	3.3	Feb 01, 2005	
		Body		5.35	3.475		
Frequency (MHz)	Power (dBm)	SAR <sub>1g</sub> (mW/g)	SAR <sub>10g</sub> (mW/g)	Drift (dB)	Difference percentage		Date
					1g	10g	
450 (Head)	400mW	2.05	1.28	0.0	2.0 %	-3.0 %	Dec. 13, 2005
	Normalize to 1 Watt	5.125	3.2				
450 (Body)	400mW	2.12	1.33	-0.1	-0.9 %	-4.3 %	Dec. 13, 2005
	Normalize to 1 Watt	5.3	3.325				

### 9.3 Dosimetric Assessment Setup

#### 9.3.1 Headset Test Position – Body-Worn

##### Body-Worn Configuration

Body-worn operating configurations should be tested with the belt-clips and holsters attached to the device and positioned against a flat phantom in normal use configurations. Devices with a handset output should be tested with a handset connected to the device.

Body-worn accessories may not always be supplied or available as options for some devices that are intended to be authorized for body-worn use. A separation distance of 1.5 cm between the back of the device and a flat phantom is recommended for testing body-worn SAR compliance under such circumstances.

For this test :

- The EUT is placed into the holster/belt clip and the holster is positioned against the surface of the phantom in a normal operating position.
- Since this EUT doesn't supply any body-worn accessory to the end user, a distance of 1.5 cm was tested to confirm the necessary "minimum SAR separation distance".  
(\* **Note** : this distance includes the 2 mm phantom shell thickness.)

### **9.3.2 Measurement Procedures**

**The evaluation was performed with the following procedures :**

**Surface Check :** A surface check job gathers data used with optical surface detection. It determines the distance from the phantom surface where the reflection from the optical detector has its peak. Any following measurement jobs using optical surface detection will then rely on this value. The surface check performs its search a specified number of times, so that the repeatability can be verified.

**Reference :** The reference job measures the field at a specified reference position, at 4 mm from the selected section's grid reference point.

**Area Scan :** The area scan is used as a fast scan in two dimensions to find the area of high field values, before doing a finer measurement around the hot spot. The sophisticated interpolation routines can find the maximum locations even in relatively coarse grids. When an area scan has measured all reachable points, it computes the field maxima found in the scanned area, within a range of the global maximum. Any following zoom scan within the same procedure will then perform fine scans around these maxima. The area covered the entire dimension of the EUT and the horizontal grid spacing was 15 mm x 15 mm.

**Zoom Scan :** Zoom scans are used to assess the highest averaged SAR for cubic averaging volumes with 1 g and 10 g of simulated tissue. The zoom scan measures 5 x 5 x 7 points in a 32 x 32 x 30 mm cube whose base faces are centered around the maxima returned from a preceding area scan within the same procedure.

**Drift :** The drift job measures the field at the same location as the most recent reference job within the same procedure, with the same settings. The drift measurement gives the field difference in dB from the last reference measurement. Several drift measurements are possible for each reference measurement. This allows monitoring of the power drift of the device in the batch process. If the value changed by more than 5%, the evaluation was repeated.

#### **9.4 Spatial Peak SAR Evaluation**

The DASY4 software includes all numerical procedures necessary to evaluate the spatial peak SAR values. Based on the Draft: SCC-34, SC-2, WG-2 - Computational Dosimetry, IEEE P1529/D0.0 (Draft Recommended Practice for Determining the Spatial-Peak Specific Absorption Rate (SAR) Associated with the Use of Wireless Handsets - Computational Techniques), a new algorithm has been implemented. The spatial-peak SAR can be computed over any required mass.

The base for the evaluation is a "cube" measurement in a volume of  $(32 \times 32 \times 30) \text{mm}^3$  (5x5x7 points). The measured volume must include the 1g and 10g cubes with the highest averaged SAR values. For that purpose, the center of the measured volume is aligned to the interpolated peak SAR value of a previously performed area scan. If the 10g cube or both cubes are not entirely inside the measured volumes, the system issues a warning regarding the evaluated spatial peak values within the Postprocessing engine (SEMCAD). This means that if the measured volume is shifted, higher values might be possible. To get the correct values you can use a finer measurement grid for the area scan. In complicated field distributions, a large grid spacing for the area scan might miss some details and give an incorrectly interpolated peak location.

The entire evaluation of the spatial peak values is performed within the Postprocessing engine (SEMCAD). The system always gives the maximum values for the 1g and 10g cubes. The algorithm to find the cube with highest averaged SAR is divided into three stages:

#### **Interpolation and Extrapolation**

The probe is calibrated at the center of the dipole sensors which is located 1 to 2.7mm away from the probe tip. During measurements, the probe stops shortly above the phantom surface, depending on the probe and the surface detecting system. Both distances are included as parameters in the probe configuration file. The software always knows exactly how far away the measured point is from the surface. As the probe cannot directly measure at the surface, the values between the deepest measured point and the surface must be extrapolated.

In DASY4, the choice of the coordinate system defining the location of the measurement points has no influence on the uncertainty of the interpolation, Maxima Search and SAR extrapolation routines. The interpolation, Maxima Search and extrapolation routines are all based on the modified Quadratic Shepard's method [7].

## **10. Measurement Uncertainty**

Measurement uncertainties in SAR measurements are difficult to quantify due to several variables including biological, physiological, and environmental. However, we estimate the measurement uncertainties in SAR to be less than  $\pm 27\%$  [ 8 ] .

According to Std. C95.3 [ 9 ] , the overall uncertainties are difficult to assess and will vary with the type of meter and usage situation. However, accuracy's of  $\pm 1$  to 3 dB can be expected in practice, with greater uncertainties in near-field situations and at higher frequencies (shorter wavelengths), or areas where large reflecting objects are present. Under optimum measurement conditions, SAR measurement uncertainties of at least  $\pm 2$ dB can be expected.

According to CENELEC [ 10 ] , typical worst-case uncertainty of field measurements is  $\pm 5$  dB. For well-defined modulation characteristics the uncertainty can be reduced to  $\pm 3$  dB.

Source of Uncertainty	Uncertainty Value	Probability Distribution	Divisor	$C_j$	Standard Uncertainty $\pm 1\%$ (1-g)	$V_j$ or $V_{eff}$

SAR is basically proportional to average transmit power and duty cycle

(i.e. SAR = P x T where P is the average transmit power and T is the transmit duty cycle).

$$SAR_{(unknown)} = SAR_{(know)} \times (P_x T_x / P_{(known)} T_{(known)})$$

Where

P<sub>x</sub> is the unknown power (i.e. the power at the highest drift)

T<sub>x</sub> is the transmit duty cycle used at that unknown power.

If transmitter duty cycle is the same then it should be a relationship of P<sub>x</sub>/P<sub>known</sub>)

Frequency		Battery	SAR <sub>1g</sub> [mW/g]		power drift (dB)	+ power drift 10 <sup>^(dB/10)</sup>	SAR <sub>1g</sub> [mW/g] (include +power drift)	
MHz	Ch.		Duty Cycle				Duty Cycle	
			100%	50%			100%	50%
467.6375	11	Ni-MH	0.587	0.294	-0.189	1.044	0.613	<b>0.307</b>
467.6375	11	ALKALINE	0.480	0.240	-0.036	1.008	0.484	0.242

SAR is basically proportional to average transmit power and duty cycle

(i.e. SAR = P x T where P is the average transmit power and T is the transmit duty cycle).

$$SAR_{(unknown)} = SAR_{(know)} \times (P_x T_x / P_{(known)} T_{(known)})$$

Where

P<sub>x</sub> is the unknown power (i.e. the power at the highest drift)

T<sub>x</sub> is the transmit duty cycle used at that unknown power.

If transmitter duty cycle is the same then it should be a relationship of P<sub>x</sub>/P<sub>known</sub>)

**Figure18.**  
**SAR Test Setup w/o Belt Clip**

**11.7 Std. C95.1-1999 RF Exposure Limit**

<b>Human Exposure</b>	<b>Population Uncontrolled Exposure ( W/kg ) or ( mW/g)</b>	<b>Occupational Controlled Exposure ( W/kg ) or ( mW/g)</b>
<b>Spatial Peak SAR*</b> (head)	1.60	8.00
<b>Spatial Peak SAR**</b> (Whole Body)	0.08	0.40
<b>Spatial Peak SAR***</b> (Hands / Feet / Ankle / Wrist )	4.00	20.00

**Table 7. Safety Limits for Partial Body Exposure**

**Notes :**

- \* The Spatial Peak value of the SAR averaged over any 1 gram of tissue.  
( defined as a tissue volume in the shape of a cube ) and over the appropriate averaging time.
- \*\* The Spatial Average value of the SAR averaged over the whole – body.
- \*\*\* The Spatial Peak value of the SAR averaged over any 10 grams of tissue.  
( defined as a tissue volume in the shape of a cube ) and over the appropriate averaging time.

**Population / Uncontrolled Environments :** are defined as locations where there is the exposure of individuals who have no knowledge or control of their exposure.

**Occupational / Controlled Environments :** are defined as locations where there is exposure that may be incurred by persons who are aware of the potential for exposure, (i.e. as a result of employment or occupation).

**12. Conclusion**

The SAR test values found for the portable mobile phone **Giant Electronics Ltd. Trade Name : Motorola Model(s) : FV600**, are below the maximum recommended level of 1.6 W/kg ( mW/g ).

### Appendix A – System Performance Check

Test Laboratory: A Test Lab Techno Corp.

Date/Time: 12/13/2005 5:45:37 PM

#### System Performance Check at 450MHz\_Head\_20051213

DUT: Dipole 450 MHz; Type: D450V2; Serial: D450V2 - SN:1021

Communication System: CW; Frequency: 450 MHz; Duty Cycle: 1:1

Medium: Head 450MHz Medium parameters used:  $f = 450 \text{ MHz}$ ;

$s = 0.84 \text{ mho/m}$ ;  $\epsilon_r = 44.77$ ; density =  $1000 \text{ kg/m}^3$

Phantom section: Flat Section

Measurement Standard: DASY4 (High Precision Assessment)

DASY4 Configuration:

- Probe: ET3DV6 - SN1530-LF; ConvF(7.27, 7.27, 7.27); Calibrated: 9/6/2005
- Sensor-Surface: 4mm (Mechanical Surface Detection)
- Electronics: DAE3 Sn393; Calibrated: 1/8/2004
- Phantom: SAM 12; Type: SAM v4.0; Serial: TP:1009
- Measurement SW: DASY4, V4.6 Build 23; Postprocessing SW: SEMCAD, V1.8 Build 160

#### Flat/Area Scan (61x181x1):

Measurement grid:  $dx=15\text{mm}$ ,  $dy=15\text{mm}$  ; Maximum value of SAR (interpolated) =  $2.21 \text{ mW/g}$

#### Flat/Zoom Scan (7x7x7)/Cube 0:

Measurement grid:  $dx=5\text{mm}$ ,  $dy=5\text{mm}$ ,  $dz=5\text{mm}$

Reference Value =  $51.7 \text{ V/m}$ ; Power Drift =  $-0.004 \text{ dB}$

Peak SAR (extrapolated) =  $3.68 \text{ W/kg}$

SAR(1 g) =  $2.05 \text{ mW/g}$ ; SAR(10 g) =  $1.28 \text{ mW/g}$

Maximum value of SAR (measured) =  $2.20 \text{ mW/g}$
