| :--- | :--- |
| Antenna Type | $:$ PIFA antenna |
| Connector Type | $:$ Fixed |

Total Quality. Assured.

### 1.4. Operation mode

The EUT was supplied with DC 5.0 V from Notebook PC.
TX-MODE is based on a specific test program "RTL819x 3.3 ", and the program can select different frequency and modulation.

The signal is maximized through rotation and placement in the three orthogonal axes.

X axis

$Y$ axis

Z axis

After verifying three axes, we found the maximum electromagnetic field was occurred at Z axis. The final test data was executed under this configuration.

Total Quality. Assured.

With individual verifying, the maximum output power were found out 1 Mbps data rate for 802.11b mode, 6 Mbps data rate for 802.11 g mode, 6.5 Mbps data rate for $802.11 \mathrm{n}(\mathrm{HT20})$ mode and, 13.5 Mbps data rate for 802.11 n (HT40) mode the final tests were executed under these conditions recorded in this report individually.

Step 2 Using the maximum conducted output power in the fundamental emission demonstrates compliance. The EUT must be configured to transmit continuously at full power over the measurement duration.
Step 3 Use the peak marker function to determine the maximum amplitude level within the RBW.

| :---: | :---: | :---: |
| Detector | QP | Peak and Average |
|  | $9-150 \mathrm{kHz} ; 200-300 \mathrm{~Hz}$ | 1 MHz |
| RBW | $0.15-30 \mathrm{MHz} ; 9-10 \mathrm{kHz}$ |  |

| Sweep | Auto couple | Auto couple |
| Start Frequency | 9 kHz | 1 GHz |
| Stop Frequency | 1 GHz | Tenth harmonic |
| Attenuation | Auto | Auto |

### 6.2. Test Procedure

Step 1 Configure the EUT according to ANSI C63.10:2013. The EUT was placed on the top of the turntable 0.8 meter (below 1 GHz ) and 1.5 meter (above 1 GHz ) above ground. The center of the receiving antenna mounted on the top of a height-variable antenna tower was placed 3 meters far away from the turntable.
Step 2 Power on the EUT and all the companion devices. The turntable was rotated by 360 degree to find the position of the maximum emission level.
Step 3 The height of the receiving antenna was varied between one meter and four meters above ground to find the maximum emission field strength of the both horizontal and vertical polarization.
Step 4 If find the frequencies above the limit or below within 3 dB , the antenna tower was scan (from 1 m to 4 m ) and then the turntable was rotated to find the maximum reading.
Step 5 Set the test-receiver system to peak or CISPR quasi-peak detector with specified bandwidth under maximum hold mode.
Step 6 For emissions above 1 GHz , use 1 MHz VBW and 3 MHz RBW for reading in spectrum analyzer.
Place the measurement antenna away from each area of the EUT determined to be a source of emissions at the specified measurement distance, while keeping the measurement antenna aimed at the source of emissions at each frequency of significant emissions, with polarization oriented for maximum response.
Step 7 If the emissions level of the EUT in peak mode was 3dB lower than the average limit specified then testing will be stopped and peak values of the EUT will be reported. Otherwise, the emissions which do not have 3 dB margin will be measured using the quasi-peak method for below 1 GHz .
Step 8 For testing above 1 GHz , The emissions level of the EUT in peak mode was lower than average limit, then testing will be stopped and peak values of the EUT will be reported, otherwise, the emission will be measured in average mode again and reported.

Step 9 In case the emission is lower than 30 MHz , loop antenna has to be used for measurement and the recorded data should be quasi-peak measured by receiver.

## 8. AC Power Line Conducted Emission

### 8.1. Measuring instrument setting

| Receiver Function | Setting |
| :---: | :---: |
| Detector | QP |
| Start frequency | 0.15 MHz |
| Stop frequency | 30 MHz |
| IF bandwidth | 9 kHz |
| Attenuation | 10 dB |

### 8.2. Test Procedure

Step 1 Configure the EUT according to ANSI C63.10:2013. The EUT or host of EHT has to be placed 0.4 meter far from the conducting wall of the shielding room and at least 80 centimeters from any other grounded conducting surface.

Step 2 Connect EUT or host of EUT to the power mains through a line impedance stabilization network.

Step 3 All the companion devices are connected to the other LISN. The LISN should provide 50Uh/50ohms coupling impedance.

Step 4 The frequency range from 150 kHz to 30 MHz was searched.

Step 5 Set the test-receiver system to peak detector and specified bandwidth with maximum hold mode.

Step 6 The measurement has to be done between each power line and ground at the power terminal.
