

TESTS AND MEASUREMENTS

TESTS AND MEASUREMENTS

Product Description

The equipment under test (EUT) is a RELM Communications, Model GPH, handheld VHF Radio. The GPH Series Radios are self-contained VHF FM Transceivers covering the frequency range of 148 MHz to 174 MHz. The units are multi-channel, digitally synthesized radios using a single crystal for frequency control. All models incorporate an EEPROM for the storage of channel frequency, Code Guard™ and Dual tone Multiple Frequency/Automatic Numeric Identifier (DTMF/ANI) encode information. All models also include low battery and busy channel indicators. Toggle switches control hi/low transmit power, priority scan, and multi-channel scan. Status and channel information is displayed over a liquid crystal display on Keyboard/Display models. Connectors are provided on the side of the unit for external antenna, microphone, speaker, and other optional accessories. A variety of twist-off battery packs are also available.

Test Methodology

Prepared in accordance with the requirements of FCC Rules and Regulations Part 2 Subpart F, Paragraphs 2.983 through 2.999 and applicable portions of Parts 24, 74, 80 and 90. All measurements are peak unless stated otherwise. The video filter associated with the spectrum analyzer was off throughout the evaluation process. Interconnecting cables were manipulated as necessary to maximize emissions. A block diagram of the tested system is shown in Figure 1.

Test Facility

Testing was performed at US Tech's measurement facility as described to the FCC and acknowledged in their letter marked 31040/SIT/US TECH. Additionally this site has also been fully described and submitted to Industry Canada (IC), and has been approved under file number IC2982.

Test Equipment

Table 1 describes test equipment used to evaluate this product.

Modifications

US Tech did not make any modifications to bring the EUT into compliance.

MEASUREMENT PROCEDURE

Subpart 2.985(a), 90.205(d), and 74.461

RF Power Output

The EUT was directly connected to a spectrum analyzer with the input resistance set to 50Ω. An external 30 dB attenuation was used during the test. The maximum RF output power was measured and compared to the manufacturer's rating. The connector and cable that was used to connect the EUT to the spectrum analyzer has an unknown loss.

FCC Minimum Standard

Typically (+/-) 20 % of the manufacturer's rated output power and less than the maximum power.

Mfg. Rated Power: +37.8 dBm/6000.0 mW across 50 Ω at output terminals

Power Measured (corrected)

		<u>Power (dBm)</u>	<u>Power (mW)</u>

MEASUREMENT PROCEDURE

Subpart 2.993(a), 90.211(c), 80.211(f), 22.359(a), and 74.462(c)

Field Strength of Spurious Radiation

Spurious emissions were evaluated from 30 MHz to 2.0 GHz at an EUT to antenna distance of 3 meters. The handset was tested with a new battery. Measurements for 30 to 1000 MHz were made with the analyzer's bandwidth set to 120 kHz. Measurements above 1000 MHz were made with the analyzer's bandwidth set to 1 MHz. Since the EUT is part of a portable handheld configuration, the EUT was rotated through three orthogonal axis to produce the highest emission relative to the limit.

This level is interpolated to 30 meters using:

$$\text{dBm @ 3 meters} + 20 \log(3/30) = \text{dBm @ 30 meters}$$

this level is compared to the level a transmitter would produce at 30 meters if connected to a 1/2 wave dipole using:

$$E = \frac{(30 \text{ Pt Gt})^{1/2}}{d} \text{ volts per meter}$$

E = Field intensity (volts per meter)

Pt = Power output of transmitter (watts)

Gt = Gain of antenna (1.64 for 1/2 wave dipole)

d = distance (meters)

Example: A 25 watt transmitter would produce

$$\frac{[(30)(25)(1.64)]^{1/2}}{30.0} \text{ volts per meter}$$

= 1,150,635 microvolts per meter @ 30 meters

FCC Minimum Standard

25 kHz Channel Bandwidth

$43 + 10 \log_{10} (P) = \text{attenuation below carrier (dB)}$

Table 3A $43 + 10 \log (6.7) = 51.3 \text{ dB}$

12.5 kHz Channel Bandwidth

MEASUREMENT PROCEDURE

Frequency Stability

Subpart 2.995, 90.213, 80.209, 22.355, and 74.464

The frequency tolerance of the carrier signal was measured by RELM Corporation while ambient temperature was varied from -33 to 65 degrees centigrade. The frequency tolerance was verified at 5 degree increments. The EUT was tested with fully charged batteries. The supply voltage was varied from 8.5 Volts to 11.5 Volts. The data is shown in the following tables and figures.

FCC Minimum Standard
