

## **Product Description**

The WAP-B11/WAP-B11i (IEEE 802.11b compatible 11 Mbps WLAN Access Point) is a long-range, high performance LAN product, which provides Access Point services to a 2.4 GHz RF network and bridges to an Ethernet backbone. WAP-B11/WAP-B11i is a highly integrated Access Point designed to combine legacy LANs with wireless LANs. WAP-B11/WAP-B11i performs all the necessary inter-networking and bridging functions. It receives data from both networks, stores them locally for further processing, installs and maintains connections and transmits the packets to the proper destination. This User Guide describes the steps required for the initial set up of the AP IP address, the AP configuration, and the firmware upgrade procedure. The description includes the implementation of the above steps through both Ethernet and USB.
