Section 1 - About This Document

This guide describes setup, configuration, administration and maintenance for the D-Link DWL-x600AP Unified Access Point (UAP) on a wireless network.

Document Organization

The Unified Access Point Administrator's Guide contains the following sections:

- •) "Section 1 About This Document" on page 9
- •) "Section 2 Getting Started" on page 11
- •) "Section 3 Viewing Access Point Status" on page 22
- •) "Section 4 Managing the Access Point" on page 36
- •) "Section 5 Configuring Access Point Services" on page 69
- •) "Section 6 Configuring SNMPv3" on page 80
- •) "Section 7 Maintaining the Access Point" on page 84
- •) "Section 8 Configuring Client Quality of Service (QoS)" on page 93
- •) "Section 9 Clustering Multiple APs" on page 109
- •) "Appendix A Default AP Settings" on page 120
- •) "Appendix B Configuration Examples" on page 122

Additional Documentation

The following documentation provides additional information about Unified Access Point software:

- •) The Unified Access Point CLI Command Reference describes the commands available from the command-line interface (CLI) for managing, monitoring, and configuring the switch.
- •) The User Manual for the D-Link Unified Wired and Wireless System provides information about setting up and managing the Unified Wireless Switch (UWS), including information about how to use the switch to manage multiple UAPs.
- •) Release notes for the D-Link Unified Wired and Wireless System detail the platform-specific functionality of the software packages, including issues and workarounds.

Document Conventions

This section describes the conventions this document uses.

Note: A note provides more information about a feature or technology and cross-references to related topics.

Caution! A caution provides information about critical aspects of AP configuration, combinations of settings, events, or procedures that can adversely affect network connectivity, security, and so on.

The following table describes the typographical conventions used in this guide.

Symbol	Example	Description
Bold	Click Apply to save your settings.	Menu titles, page names, and button names.
Blue Text	See "Document Conventions" on page 9	Hyperlink text.
Courier Font	WLAN-AP# show network	Screen text, file names, commands, user-typed command-line entries.
Courier Font Italics	Value	Command parameter, which might be a variable or fixed value.
Square Brackets []	[Value]	Indicates an optional fixed parameter.

Symbol	Example	Description
Curly Braces {}	{Choice1 Choice2}	Indicates that you must select a parameter from the list of choices.
Vertical Bars	Choice1 Choice2	Separates the mutually exclusive choices.
Braces within square brackets [{}]	[{Choice1 Choice2}]	Indicate a choice within an optional element.

Table 1 - Typographical Conventions

Online Help, Supported Browsers, and Limitations

Online help for the UAP Administration Web pages provides information about all fields and features available from the user interface (UI). The information in the online help is a subset of the information available in the *Unified Access Point Administrator's Guide*.

Online help information corresponds to each page on the UAP Administration UI.

For information about the settings on the current page, click the Help link on the upper right side of a page.

The following figure shows an example of the online help available from the links on the user interface.

Basic Settings

From the Basic Settings page, you can view various information about the UAP, including IP and MAC address information, and configure the administrator password for the UAP.

Field	Description	
IP Address	Shows the IP address assigned to the AP. This field is not editable on this page because the IP address is already assigned (either by DHCP, or statically through the Ethernet Settings page).	
IPv6 Address	Shows the IPv6 address assigned to the AP. This field is not editable on this page because the IP address is already assigned (either by DHCPv6, or statically through the Ethernet Settings page).	
IPv6 Link Local Address	Shows the IPv6 Link Local address, which is the IPv6 address used by the local physical link. The link local address is not configurable and is assigned by using the IPv8 Neighbor Discovery process.	
MAC Address	Shows the MAC address of the AP. The address shown here is the MAC address associated with the management interface. This is the address by which the AP is known axternally to other networks.	
Firmware Version	Shows version information about the firmware currently installed on the AP. As new versions of the WLAN AP firmware become available, you can upgrade the firmware on your APs.	
Product Identifier	Identifies the AP hardware model.	
Hardware Version	Identifies the AP hardware version.	
Device Name	Genetic name to identify the type of hardware.	
Device Description	Provides information about the product hardware.	
Current Password	Enter the current administrator password. You must correctly enter the current password before you are able to change it.	
New Password	Enter a new administrator password. The characters you enter are displayed as build characters to prevent others from seeing your password as you type. The administrator password must be an alphanumeric string of up to 8 characters. Do not use special characters or spaces. Note: As an immediate first step in security your wireless network, we recommend that you change the administrator password from the default.	
Confirm New Password	Re-enter the new administrator password to confirm that you typed it as intended.	
Baud Rate	Select a baud rate for the selisit port connection. The baud rate on the AP must match the baud rate on the terminal or terminal emulator to connect to the AP command-line interface (CLI) by using a serial (console) connection. The following baud rates are available: 9000 19200 38400 507000 115200	
System Name	Enter a name for the AP. This name appears only on the Basic Settings page and is a name to identify the AP to the administrator. Use up to 64 alphanumetic characters, for example Mr AP.	

Figure 1 - Administrator UI Online Help

Section 2 - Getting Started

The D-Link DWL-x600AP unified access point (UAP) provides continuous, high-speed access between wireless devices and Ethernet devices. It is an advanced, standards-based solution for wireless networking in businesses of any size. The UAP enables wireless local area network (WLAN) deployment while providing state-of-the-art wireless networking features.

The UAP can operate in two modes: Standalone Mode or Managed Mode. In Standalone Mode, the UAP acts as an individual access point in the network, and you manage it by using the Administrator Web User Interface (UI), command-line interface (CLI), or SNMP. In Managed Mode, the UAP is part of the D-Link Unified Wired and Wireless System, and you manage it by using the D-Link Unified Wireless Switch. If an AP is in Managed Mode, the Administrator Web UI, Telnet, SSH, and SNMP services are disabled.

This document describes how to perform the setup, management, and maintenance of the UAP in Standalone Mode. For information about configuring the AP in Managed Mode by using the D-Link Unified Wireless Switch, see the *User Manual* for the switch.

Before you power on a new UAP, review the following sections to check required hardware and software components, client configurations, and compatibility issues. Make sure you have everything you need for a successful launch and test of your new or extended wireless network.

The DWL-6600AP and DWL-8600AP are dual-radio access points and support the IEEE 802.11a, 802.11b, 802.11g, and 802.11n modes. The DWL-2600AP and DWL-3600AP are single-radio access points and support the IEEE 802.11b, IEEE 802.11g, and 802.11n (2.4 GHz) modes. The DWL-3610AP is a single-radio access point that supports both 2.4 GHz (IEEE 802.11b, 802.11g, 2.4 GHz IEEE 802.11n) and 5 GHz (IEEE 802.11a, 802.11n, 802.11ac) modes. The DWL-6610, DWL-8610, and DWL-8710 are dual radio access points and support all the modes (IEEE 802.11a, IEEE 802.11b, IEEE 802.11b, IEEE 802.11c, and IEEE 802.11ac)

This section contains the following topics:

- •) "Administrator's Computer Requirements" on page 11
- •) "Wireless Client Requirements" on page 12
- •) "Dynamic and Static IP Addressing on the AP" on page 13
- •) "Installing the UAP" on page 13
- •) "Basic Settings" on page 16
- •) "Using the CLI to View the IP Address" on page 17
- •) "Configuring the Ethernet Settings" on page 18
- •) "Configuring IEEE 802.1X Authentication" on page 19
- •) "Verifying the Installation" on page 20
- •) "Configuring Security on the Wireless Access Point" on page 21

To manage the UAP by using the Web interface or by using the CLI through Telnet or SSH, the AP needs an IP address. If you use VLANs or IEEE 802.1X Authentication (port security) on your network, you might need to configure additional settings on the AP before it can connect to the network.

Note: The WLAN AP is not designed to function as a gateway to the Internet. To connect your WLAN to other LANs or the Internet, you need a gateway device.

Administrator's Computer Requirements

The following table describes the minimum requirements for the administrator's computer for configuration and administration of the UAP through a Web-based user interface (UI).

Required Software or Component	Description
Serial or Ethernet Connection to the	The computer used to configure the first access point must be connected
Access Point	to the access point by a serial cable or an Ethernet cable.

Required Software or Component	Description
Wireless Connection to the Network	After initial configuration and launch of the first access point on your new wireless network, you can make subsequent configuration changes through the Administration Web pages using a wireless connection to the internal network.
	 need Wi-Fi capability similar to that of any wireless client: Portable or built-in Wi-Fi client adapter that supports one or more of the IEEE 802.11 modes in which you plan to run the access point. Wireless client software configured to associate with the UAP.
Web Browser and Operating System	Configuration and administration of the UAP is provided through a Web- based user interface hosted on the access point. We recommend using one of the following supported Web browsers to access the access point Administration Web pages:
	 Microsoft[®] Internet Explorer[®] version 7.x or 8.x (with up-to-date patch level for either major version) Mozilla[®] Firefox version 3.5 or later Safari 5 and later versions
	The administration Web browser must have JavaScript™ enabled to support the interactive features of the administration interface.
	Note: DWL-3610AP and DWL-6610B1AP support the following web browsers:
	 Microsoft[®] Internet Explorer[®] version 8.x or 9.x (with up-to-date patch level for either major version) Mozilla[®] Firefox version 26.0 or later Chrome on Windows (for AP only) version 32.0 or later
Security Settings	Ensure that security is disabled on the wireless client used to initially configure the access point.

Table 2 - Requirements for the Administrator's Computer

Wireless Client Requirements

The UAP provides wireless access to any client with a properly configured Wi-Fi client adapter for the 802.11 mode in which the access point is running. The UAP supports multiple client operating systems. Clients can be laptop or desktop computers, personal digital assistants (PDAs), or any other hand-held, portable or stationary device equipped with a Wi-Fi adapter and supporting drivers.

To connect to the access point, wireless clients need the software and hardware described in the following table.

Required Component	Description
Wi-Fi Client Adapter	Portable or built-in Wi-Fi client adapter that supports one or more of the IEEE 802.11 modes in which you plan to run the access point.
Wireless Client Software	Client software, such as Microsoft Windows Supplicant, configured to associate with the UAP.

Required Component	Description
Client Security Settings	Security should be disabled on the client used to do initial configuration of the access point.
	If the Security mode on the access point is set to anything other than plain text, wireless clients will need to set a profile to the authentication mode used by the access point and provide a valid username and password, certificate, or similar user identity proof. Security modes are Static WEP, IEEE 802.1X, WPA with RADIUS server, and WPA-PSK.
	For information about configuring security on the access point, see "Virtual Access Point Settings" on page 50.

 Table 3 - Requirements for Wireless Clients

Dynamic and Static IP Addressing on the AP

When you power on the access point, the built-in DHCP client searches for a DHCP server on the network in order to obtain an IP Address and other network information. If the AP does not find a DHCP server on the network, the AP continues to use its default Static IP Address (10.90.90.91) until you re-assign it a new static IP address (and specify a static IP addressing policy) or until the AP successfully receives network information from a DHCP server.

To change the connection type and assign a static IP address by using the CLI, see "Configuring the Ethernet Settings" on page 18 or, by using the Web UI, see "Ethernet Settings" on page 36.

Caution! If you do not have a DHCP server on your internal network, and do not plan to use one, the first thing you must do after powering on the access point is change the connection type from DHCP to static IP. You can either assign a new static IP address to the AP or continue using the default address. We recommend assigning a new static IP address so that if you bring up another
WLAN AP on the same network, the IP address for each AP will be unique.

Recovering an IP Address

If you experience trouble communicating with the access point, you can recover a static IP address by resetting the AP configuration to the factory defaults (see "Resetting the Factory Default Configuration" on page 86), or you can get a dynamically assigned address by connecting the AP to a network that has a DHCP server.

Discovering a Dynamically Assigned IP Address

If you have access to the DHCP server on your network and know the MAC address of your AP, you can view the new IP address associated with the MAC address of the AP.

If you do not have access to the DHCP server that assigned the IP address to the AP or do not know the MAC address of the AP, you might need to use the CLI to find out what the new IP address is. For information about how to discover a dynamically assigned IP address, see "Using the CLI to View the IP Address" on page 17.

Installing the UAP

To access the Administration Web UI, you enter the IP address of the AP into a Web browser. You can use the default IP address of the AP (10.90.90.91) to log on to the AP and assign a static IP address, or you can use a DHCP server on you network to assign network information to the AP. The DHCP client on the AP is enabled by default.

To install the UAP, use the following steps:

1.) Connect the AP to an administrative PC by using a LAN connection or a direct-cable connection.

•) To use a LAN connection, connect one end of an Ethernet cable to the network port on the access point and the other end to the same hub where your PC is connected, as shown in the following figure.

The hub or switch you use must permit broadcast signals from the access point to reach all other devices on the network.

•) To use a direct-cable connection, connect one end of an Ethernet straight-through or crossover cable to the network port on the access point and the other end of the cable to the Ethernet port on the PC, as shown in the following figure. You can also use a serial cable to connect the serial port on the AP to a serial port on the administrative computer.

For initial configuration with a direct Ethernet connection and no DHCP server, be sure to set your PC to a static IP address in the same subnet as the default IP address on the access point. (The default IP address for the access point is 10.90.90.91.)

If you use this method, you will need to reconfigure the cabling for subsequent startup and deployment of the access point so that the access point is no longer connected directly to the PC but instead is connected to the LAN (either by using a hub or directly).

	Note: It is possible to detect access points on the network with a wireless connection. However,
	we strongly advise against using this method. In most environments you may have no way
	of knowing whether you are actually connecting to the intended AP. Also, many of the initial
	configuration changes required will cause you to lose connectivity with the AP over a wireless
	connection.

- 2.) Connect the power adapter to the power port on the back of the access point, and then plug the other end of the power cord into a power outlet.
- 3.) Use your Web browser to log on to the UAP Administration Web pages.
 - •) If the AP did not acquire an IP address from a DHCP server on your network, enter 10.90.90.91 in the address field of your browser, which is the default IP address of the AP.
 - •) If you used a DHCP server on your network to automatically configure network information for the AP, enter the new IP address of the AP into the Web browser.
 - •) If you used a DHCP server and you do not know the new IP address of the AP, use the following procedures to obtain the information:
 - •) Connect a serial cable from the administrative computer to the AP and use a terminal emulation program to access the command-line interface (CLI).
 - •) At the login prompt, enter admin for the user name and admin for the password. At the command prompt, enter get management.
 - •) The command output displays the IP address of the AP. Enter this address in the address field of your browser. For a more detailed explanation about how to log on to the CLI by using the console port, see "Using the CLI to View the IP Address" on page 24.
- 4.) When prompted, enter *admin* for the user name and *admin* for the password, then click Logon.

Figure 2 - Web UI Login Prompt

After you log in, the **Basic Settings** page for UAP administration is displayed, as the following figure shows.

		D-Link Wireless Access Poir

Figure 3 - Provide Basic Settings

- 5.) Verify the settings on the **Basic Settings** page.
 - •) Review access point description and provide a new administrator password for the access point if you do not want to use the default password, which is *admin*.
 - •) Click the **Apply** button to activate the wireless network with these new settings.

Note: The changes you make are not saved or applied until you click Apply. Changing some
access point settings might cause the AP to stop and restart system processes. If this happens,
 wireless clients will temporarily lose connectivity. We recommend that you change access point
settings when WLAN traffic is low.

For information about the fields and configuration options on the Basic Settings page, see "Basic Settings" on page 16.

6.) If you do not have a DHCP server on the management network and do not plan to use one, you must change the Connection Type from DHCP to Static IP.

You can either assign a new Static IP address to the AP or continue using the default address. We recommend assigning a new Static IP address so that if you bring up another UAP on the same network, the IP address for each AP will be unique. To change the connection type and assign a static IP address, see "Configuring the Ethernet Settings" on page 18 (CLI) or "Ethernet Settings" on page 36 (Web).

7.) If your network uses VLANs, you might need to configure the management VLAN ID or untagged VLAN ID on the UAP in order for it to work with your network.

For information about how to configure VLAN information, see "Configuring the Ethernet Settings" on page 18 (CLI) or "Ethernet Settings" on page 36 (Web).

8.) If your network uses IEEE 802.1X port security for network access control, you must configure the 802.1X supplicant information on the AP.

For information about how to configure the 802.1X user name and password, see "Configuring IEEE 802.1X Authentication" on page 19.

Basic Settings

From the Basic Settings page, you can view various information about the UAP, including IP and MAC address information, and configure the administrator password for the UAP. The following table describes the fields and configuration options on the **Basic Settings** page.

Field	Description
IP Address	Shows the IP address assigned to the AP. This field is not editable on this page because the IP address is already assigned (either by DHCP, or statically through the Ethernet Settings page).
IPv6 Address	Shows the IPv6 address assigned to the AP. This field is not editable on this page because the IP address is already assigned (either by DHCPv6, or statically through the Ethernet Settings page).
IPv6 Address Status	Shows the operational status of the static IPv6 address assigned to the management interface of the AP. The possible values are Operational and Tentative.
IPv6 Auto- configured Global Addresses	Shows each automatically-configured global IPv6 address for the management interface of the AP.
IPv6 Link Local Address	Shows the IPv6 Link Local address, which is the IPv6 address used by the local physical link. The link local address is not configurable and is assigned by using the IPv6 Neighbor Discovery process.
MAC Address	Shows the MAC address of the AP. The address shown here is the MAC address associated with the management interface. This is the address by which the AP is known externally to other networks.
Firmware Version	Shows version information about the firmware currently installed on the AP. As new versions of the WLAN AP firmware become available, you can upgrade the firmware on your APs.
Model	Displays the AP model number.
Product Identifier	Identifies the AP hardware model.
Hardware Version	Identifies the AP hardware version.
Serial Number	Shows the AP serial number.
Device Name	Generic name to identify the type of hardware.
Device Description	Provides information about the product hardware.
New Password	Enter a new administrator password. The characters you enter are displayed as bullet characters to prevent others from seeing your password as you type.
	special characters are also supported.
	Note: As an immediate first step in securing your wireless network, we recommend that you change the administrator password from the default.
Confirm New Password	Re-enter the new administrator password to confirm that you typed it as intended.

Field	Description
Baud Rate	Select a baud rate for the serial port connection. The baud rate on the AP must match the baud rate on the terminal or terminal emulator to connect to the AP command-line interface (CLI) by using a serial (console) connection. The following baud rates are available: •) 9600 •) 19200 •) 38400 •) 57600 •) 115200
System Name	Enter a name for the AP. This name appears only on the Basic Settings page and is a name to identify the AP to the administrator. Use up to 64 alphanumeric characters, for example My AP.
System Contact	Enter the name, e-mail address, or phone number of the person to contact regarding issues related to the AP.
System Location	Enter the physical location of the AP, for example Conference Room A.

Table 4 - Basic Settings Page

Connecting to the AP Web Interface by Using the IPv6 Address

To connect to the AP by using the IPv6 global address or IPv6 link local address, you must enter the AP address into your browser in a special format.

M n

Note: The following instructions and examples work with Microsoft Internet Explorer 7 (IE7) and might not work with other browsers. For DWL-3610AP and DWL-6610B1AP, it will work with Microsoft Internet Explorer 8 (IE8).

To connect to an IPv6 global address, add square brackets around the IPv6 address. For example, if the AP global IPv6 address is 2520::230:abff:fe00:2420, type the following address into the IE7 address field: http:// [2520::230:abff:fe00:2420].

To connect to the iPv6 link local address, replace the colons (:) with hyphens (-), add the interface number preceded with an "s," then add ".ipv6-literal.net." For example, if the AP link local address is fe80::230:abff:fe00:2420, and the Windows interface is defined as "%6," type the following address into the IE7 address field: http://fe80--230-abff-fe00-2420s6.ipv6-literal.net.

Using the CLI to View the IP Address

The DHCP client on the UAP is enabled by default. If you connect the UAP to a network with a DHCP server, the AP automatically acquires an IP address. To manage the UAP by using the Administrator UI, you must enter the IP address of the access point into a Web browser.

If a DHCP server on your network assigns an IP address to the UAP, and you do not know the IP address, use the following steps to view the IP address of the UAP:

- Using a null-modem cable, connect a VT100/ANSI terminal or a workstation to the console (serial) port. If you attached a PC, Apple, or UNIX workstation, start a terminal-emulation program, such as HyperTerminal or TeraTerm.
- 2.) Configure the terminal-emulation program to use the following settings:
 - •) Baud rate: 115200 bps
 - •) Data bits: 8
 - •) Parity: none
 - •) Stop bit: 1
 - •) Flow control: none
- 3.) Press the return key, and a login prompt should appear. The login name is *admin*. The default password is *admin*. After a successful login, the screen shows the

(Access Point Name)# prompt.

4.) At the login prompt, enter get management.

Information similar to the following prints to the screen.

115200 - HyperTerminal File Edit View Call Transfer Help 다 교 (金) (종 중 파고 관) 법

Figure 4 - Command Line Interface (CLI) Connection

Configuring the Ethernet Settings

The default Ethernet settings, which include DHCP and VLAN information, might not work for all networks.

By default, the DHCP client on the UAP automatically broadcasts requests for network information. If you want to use a static IP address, you must disable the DHCP client and manually configure the IP address and other network information.

The management VLAN is VLAN 1 by default. This VLAN is also the default untagged VLAN. If you already have a management VLAN configured on your network with a different VLAN ID, you must change the VLAN ID of the management VLAN on the access point.

For information about using the Web interface to configure the Ethernet settings, see "Ethernet Settings" on page 36. You can also use the CLI to configure the Ethernet settings, which the following section describes.

Using the CLI to Configure Ethernet Settings

Use the commands shown in the following table to view and set values for the Ethernet (wired) interface. For more information about each setting, see the description for the field in the following table.

Action	Commands
Get the DNS Name	get host id
Set the DNS Name	set host id <host_name> For example: set host id lab-ap</host_name>
Get Current Settings for the Ethernet (Wired) Internal Interface	get management
Set the management VLAN ID	set management vlan-id <1-4094>
View untagged VLAN information	get untagged-vlan
Enable the untagged VLAN	set untagged-vlan status up
Disable the untagged VLAN	set untagged-vlan status down

Action	Commands
Set the untagged VLAN ID	set untagged-vlan vlan-id <1-4094>
View the connection type	get management dhcp-status
Use DHCP as the connection type	set management dhcp-status up
Use a Static IP as the connection type	set management dhcp-status down
Set the Static IP address	<pre>set management static-ip <ip_address> For example: set management static-ip 10.10.12.221</ip_address></pre>
Set a Subnet Mask	<pre>set management static-mask <netmask> For example: set management static-mask 255.255.255.0</netmask></pre>
Set the Default Gateway	<pre>set static-ip-route gateway <ip_address> For example: set static-ip-route gateway 10.10.12.1</ip_address></pre>
View the DNS Nameserver mode Dynamic= up Manual=down	get host dns-via-dhcp
Set DNS Nameservers to Use Static IP Addresses (Dynamic to Manual Mode)	<pre>set host dns-via-dhcp down set host static-dns-1 <ip_address> set host static-dns-2 <ip_address> For example: set host static-dns-1 192.168.23.45</ip_address></ip_address></pre>
Set DNS Nameservers to Use DHCP IP Addressing (Manual to Dynamic Mode)	set host dns-via-dhcp up

Table 5 - CLI Commands for Ethernet Setting

In the following example, the administrator uses the CLI to set the management VLAN ID to 123 and to disable the untagged VLAN so that all traffic is tagged with a VLAN ID.

```
DLINK-WLAN-AP# set management vlan-id 123
DLINK-WLAN-AP# set untagged-vlan status down

Configuring IEEE 802.1X Authentication

On networks that use IEEE 802.1X, port-based network access control, a supplicant (client) cannot gain access to the network until the 802.1X authenticator grants access. If your network uses 802.1X, you must configure 802.1X authentication information that the AP can supply to the authenticator.

If your network uses IEEE 802.1X see "Configuring IEEE 802.1X Authentication" on page 19 for information about

how to configure 802.1X by using the Web interface.

Using the CLI to Configure 802.1X Authentication Information

The following table shows the commands used to configure the 802.1X supplicant information using the CLI.

Action	Command
View 802.1X supplicant settings	get dot1x-supplicant
Enable 802.1X supplicant	set dotlx-supplicant status up
Disable 802.1X supplicant	set dot1x-supplicant status down
Set the 802.1X user name	set dot1x-supplicant user <name></name>
Set the 802.1X password	set dot1x-supplicant password <password></password>

Table 6 - CLI Commands for the 802.1X Supplicant

In the following example, the administrator enables the 802.1X supplicant and sets the user name to wlanAP and the password to test1234.

```
DLINK-WLAN-AP# set dot1x-supplicant status up
DLINK-WLAN-AP# set dot1x-supplicant user wlanAP
DLINK-WLAN-AP# set dot1x-supplicant password test1234
DLINK-WLAN-AP# get dot1x-supplicant
          Value

```

Verifying the Installation

Make sure the access point is connected to the LAN and associate some wireless clients with the network. Once you have tested the basics of your wireless network, you can enable more security and fine-tune the AP by modifying advanced configuration features.

- 1.) Connect the access point to the LAN.
 - •) If you configured the access point and administrator PC by connecting both into a network hub, then your access point is already connected to the LAN. The next step is to test some wireless clients.
 - •) If you configured the access point by using a direct cable connection from your computer to the access point, do the following procedures:
 - •) Disconnect the cable from the computer and the access point.
 - •) Connect an Ethernet cable from the access point to the LAN.
 - •) Connect your computer to the LAN by using an Ethernet cable or a wireless card.
- 2.) Test LAN connectivity with wireless clients.
 - Test the UAP by trying to detect it and associate with it from some wireless client devices. For information about requirements for these clients, see "Wireless Client Requirements" on page 12.
- 3.) Secure and configure the access point by using advanced features. Once the wireless network is up and you can connect to the AP with some wireless clients, you can add in layers of security, create multiple virtual access points (VAPs), and configure performance settings.

By default, no security is in place on the access point, so any wireless client can associate with it and access

your LAN. An important next step is to configure security, as described in "Virtual Access Point Settings" on page 50.

Configuring Security on the Wireless Access Point

You configure secure wireless client access by configuring security for each virtual access point (VAP) that you enable. You can configure up to 16 VAPs per radio that simulate multiple APs in one physical access point. By default, only one VAP is enabled. For each VAP, you can configure a unique security mode to control wireless client access.

Each radio has 16 VAPs, with VAP IDs from 0-15. By default, only VAP 0 on each radio is enabled. VAP0 has the following default settings:

- •) VLAN ID: 1
- •) Broadcast SSID: Enabled
- •) SSID: dlink1
- •) Security: None
- •) MAC Authentication Type: None
- •) Redirect Mode: None

All other VAPs are disabled by default. The default SSID for VAPs 1–15 is "dlinkx" where x is the VAP ID.

To prevent unauthorized access to the UAP, we recommend that you select and configure a security option other than None for the default VAP and for each VAP that you enable.

For information about how to configure the security settings on each VAP, see "Virtual Access Point Settings" on page 50.

Section 3 - Viewing Access Point Status

This section describes the information you can view from the tabs under the **Status** heading on the Administration Web UI. This section contains the following subsections:

- •) "Viewing Interface Status" on page 22
- •) "Viewing Events" on page 23
- •) "Viewing Transmit and Receive Statistics" on page 25
- •) "Viewing Wireless Multicast Forwarding Statistics" on page 26
- •) "Viewing TSPEC Client Associations" on page 27
- •) "Viewing Rogue AP Detection" on page 29
- •) "Viewing Managed AP DHCP Information" on page 32
- •) "Viewing TSPEC Status and Statistics Information" on page 32
- •) "Viewing TSPEC AP Statistics Information" on page 33
- •) "Viewing Radio Statistics Information" on page 34
- •) "Viewing Email Alert Operational Status" on page 35

Viewing Interface Status

To monitor Ethernet LAN (wired) and wireless LAN (WLAN) settings, click the Interfaces tab.

View settings for ne	etwork interfaces
Click "Refresh" button to refresh Refresh	ih the page.
Wired Settings Internal Interface MAC Address VLAN ID IP Address Subnet Mask IPv6 Address	(Edit) 00:90:4C:34:18:40 1 10.10.21.50 255.255.0.0 1

Figure 5 - Viewing Interface Status

This page displays the current settings of the UAP. It displays the Wired Settings and the Wireless Settings.

Wired Settings (Internal Interface)

The Internal interface includes the Ethernet MAC Address, Management VLAN ID, IP Address (IPv4 and IPv6), Subnet Mask, and DNS information. To change any of these settings, click the **Edit** link. After you click **Edit**, you are redirected to the **Ethernet Settings** page.

For information about configuring these settings, see "Configuring the Ethernet Settings" on page 18.

Wireless Settings

The Radio Interface includes the AeroScout[™] Engine Communication status, Radio Mode and Channel. The **Wireless Settings** section also shows the MAC address (read-only) associated with each radio interface.

To change the Radio Mode or Channel settings, click the Edit link. After you click Edit, you are redirected to the

Modify Wireless Settings page.

For information about configuring these settings, see "Wireless Settings" on page 38 and "Modifying Radio Settings" on page 42.

Viewing Events

The **Events** page shows real-time system events on the AP such as wireless clients associating with the AP and being authenticated.

To view system events, click the Events tab.

Figure 6 - Viewing Events

From the **Events** page, you can perform the following tasks:

- •) View the most recent, high-level events generated by this AP.
- •) Enable and configure **Persistent** logging to write system event logs to non-volatile memory so that the events are not erased when the system reboots.
- •) Set a **Severity Level** to determine what category of log messages are displayed.
- •) Set **Depth** to determine how many log messages are displayed in the Event log.
- •) Enable a remote log relay host to capture all system events and errors in a Kernel Log.

Configuring Persistent Logging Options

If the system unexpectedly reboots, log messages can be useful to diagnose the cause. However, log messages are erased when the system reboots unless you enable persistent logging.

To configure persistent logging on the **Events** page, set the persistence, severity, and depth options as described in the following table, and then click **Apply**.

Field	Description							
Persistence	Choose Enabled to save system logs to non-volatile memory so that the logs are not erased when the AP reboots. Choose Disabled to save system logs to volatile memory. Logs in volatile memory are deleted when the system reboots.							
Severity	 Specify the severity level of the log messages to write to non-volatile memory. For example, if you specify 2, critical, alert, and emergency logs are written to non-volatile memory. Error messages with a severity level of 3 – 7 are written to volatile memory. •) 0 — emergency •) 1 — alert •) 2 — critical •) 3 — error •) 4 — warning •) 5 — notice •) 6 — info •) 7 — debug 							
Depth	You can store up to 128 messages in non-volatile memory and 512 messages in volatile memory. Once the number you configure in this field is reached, the oldest log event is overwritten by the new log event.							
	Table 7 - Logging Options							
	Notes To apply your sharped alight Apply Charging come acting a prinkt course the AD to star							

 Note:
 To apply your changes, click Apply. Changing some settings might cause the AP to stop and restart system processes. If this happens, wireless clients will temporarily lose connectivity. We recommend that you change AP settings when WLAN traffic is low.

Configuring the Log Relay Host for Kernel Messages

The Kernel Log is a comprehensive list of system events (shown in the System Log) and kernel messages such as error conditions, like dropping frames.

You cannot view kernel log messages directly from the Administration Web UI for an AP. You must first set up a remote server running a syslog process and acting as a syslog log relay host on your network. Then, you can configure the UAP to send syslog messages to the remote server.

Remote log server collection for AP syslog messages provides the following features:

- •) Allows aggregation of syslog messages from multiple APs
- •) Stores a longer history of messages than kept on a single AP
- •) Triggers scripted management operations and alerts

To use Kernel Log relaying, you must configure a remote server to receive the syslog messages. The procedure to configure a remote log host depends on the type of system you use as the remote host.

Note: The syslog process will default to use port 514. We recommend keeping this default port. However, if you choose to reconfigure the log port, make sure that the port number you assign to syslog is not being used by another process.

Enabling or Disabling the Log Relay Host on the Events Page

To enable and configure Log Relaying on the **Events** page, set the Log Relay options as described in the following table, and then click **Update**.

Field	Description
Relay Log	Select Enabled to allow the UAP to send log messages to a remote host. Select Disabled to keep all log messages on the local system.
Relay Host	Specify the IP Address or DNS name of the remote log server.
Relay Port	Specify the Port number for the syslog process on the Relay Host. The default port is 514.

Table 8 - Log Relay Host

Note: To apply your changes, click **Apply**. Changing some settings might cause the AP to stop and restart system processes. If this happens, wireless clients will temporarily lose connectivity. We recommend that you change AP settings when WLAN traffic is low.

If you enabled the Log Relay Host, clicking **Apply** will activate remote logging. The AP will send its kernel messages real-time for display to the remote log server monitor, a specified kernel log file, or other storage, depending on how you configured the Log Relay Host.

If you disabled the Log Relay Host, clicking **Apply** will disable remote logging.

Viewing Transmit and Receive Statistics

The **Transmit/Receive** page provides some basic information about the current AP and a real-time display of the transmit and receive statistics for the Ethernet interface on the AP and for the VAPs on all supported radio interfaces. All transmit and receive statistics shown are totals since the AP was last started. If you reboot the AP, these figures indicate transmit and receive totals since the reboot.

To view transmit and receive statistics for the AP, click the Transmit/Receive tab.

Interface	Status	HAC Address	VLAN ID	Name (SSID)

Figure 7 - Viewing Traffic Statistics

Field	Description			
Interface	The name of the Ethernet or VAP interface.			
Status	Shows whether the interface is up or down.			
MAC Address	MAC address for the specified interface. The UAP has a unique MAC address for each interface. Each radio has a different MAC address for each interface on each of its two radios.			
VLAN ID	Virtual LAN (VLAN) ID. You can use VLANs to establish multiple internal and guest networks on the same AP. The VLAN ID is set on the VAP page. (See "Configuring Load Balancing" on page 64)			
Name (SSID)	Wireless network name. Also known as the SSID, this alphanumeric key uniquely identifies a wireless local area network. The SSID is set on the VAP page. (See "Configuring Load Balancing" on page 64)			
Transmit and Receive Information				
Total Packets	Indicates total packets sent (in Transmit table) or received (in Received table) by this AP.			
Total Bytes	Indicates total bytes sent (in Transmit table) or received (in Received table) by this AP.			

Field	Description
Total Drop Packets	Indicates total number of packets sent (in Transmit table) or received (in Received table) by this AP that were dropped.
Total Drop Bytes	Indicates total number of bytes sent (in Transmit table) or received (in Received table) by this AP that were dropped.
Errors	Indicates total errors related to sending and receiving data on this AP.

Table 9 - Transmit/Receive

Viewing Wireless Multicast Forwarding Statistics

The Wireless Multicast Forwarding Transmit and Receive Statistics page provides some basic information about the current AP and a real-time display of the transmit and receive statistics for the Wireless Multicast Traffic interface on the AP and for the VAPs on the radio interface. All transmit and receive statistics shown are totals since the AP was last started. If you reboot the AP, these figures indicate transmit and receive totals since the reboot.

Figure 8 - Viewing WMF Transmit and Receive Statistics

To view transmit and receive statistics for the AP, click the Wireless Multicast Forwarding Transmit and Receive Statistics tab.

Field	Description
Network	Shows which VAP the client is associated with. For example, an entry of <i>wlan0vap2</i> means the client is associated with Radio 1, VAP 2. An entry of <i>wlan0</i> means the client is associated with VAP 0 on Radio 1. An entry of <i>wlan1</i> means the client is associated with VAP 0 on Radio 2.
Station	Shows the MAC address of the associated wireless client.
Status	 The Authenticated and Associated Status shows the underlying IEEE 802.11 authentication and association status, which is present no matter which type of security the client uses to connect to the AP. This status does not show IEEE 802.1X authentication or association status. Some points to keep in mind with regard to this field are: If the AP security mode is None or Static WEP, the authentication and association status of clients showing on the Client Associations page will be in line with what is expected; that is, if a client shows as authenticated to the AP, it will be able to transmit and receive data. (This is because Static WEP uses only IEEE 802.11 authentication.) If the AP uses IEEE 802.1X or WPA security, however, it is possible for a client association to show on this page as authenticated (via the IEEE 802.11 security) but actually not be authenticated to the AP via the second layer of security.
From Station	Shows the number of packets and bytes received from the wireless client and the number of packets and bytes that were dropped after being received.

Field	Description
To Station	Shows the number of packets and bytes transmitted from the AP to the wireless client and the number of packets and bytes that were dropped upon transmission.

Table 10 - WMF Transmit and Receive Statistics Table

Viewing Associated Wireless Client Information

Figure 9 - Viewing Client Association Information

The associated stations are displayed along with information about packet traffic transmitted and received for each station.

The following describes the fields on the **Client Associations** page.

Field	Description
Network	Shows which VAP the client is associated with. For example, an entry of <i>wlan0vap2</i> means the client is associated with Radio 1, VAP 2. An entry of <i>wlan0</i> means the client is associated with VAP 0 on Radio 1. An entry of <i>wlan1</i> means the client is associated with VAP 0 on Radio 2.
Station	Shows the MAC address of the associated wireless client.
Status	 The Authenticated and Associated Status shows the underlying IEEE 802.11 authentication and association status, which is present no matter which type of security the client uses to connect to the AP. This status does not show IEEE 802.1X authentication or association status. Some points to keep in mind with regard to this field are: If the AP security mode is None or Static WEP, the authentication and association status of clients showing on the Client Associations page will be in line with what is expected; that is, if a client shows as authenticated to the AP, it will be able to transmit and receive data. (This is because Static WEP uses only IEEE 802.11 authentication.) If the AP uses IEEE 802.1X or WPA security, however, it is possible for a client association to show on this page as authenticated (via the IEEE 802.11 security) but actually not be authenticated to the AP via the second layer of security.
From Station	Shows the number of packets and bytes received from the wireless client and the number of packets and bytes that were dropped after being received.
To Station	Shows the number of packets and bytes transmitted from the AP to the wireless client and the number of packets and bytes that were dropped upon transmission.

Table 11 - Associated Clients

Viewing TSPEC Client Associations

The **TSPEC Client Association Status and Statistics** page provides some basic information about the client associations status and a real-time display of the transmit and receive statistics for the TSPEC clients. All transmit and receive statistics shown are totals since the client association started.

A TSPEC is a traffic specification that is sent from a QoS-capable wireless client to an AP requesting a certain amount of network access for the traffic stream (TS) it represents. A traffic stream is a collection of data packets identified by the wireless client as belonging to a particular user priority. An example of a voice traffic stream is a Wi-Fi CERTIFIED[™] telephone handset that marks its codec-generated data packets as voice priority traffic. An example of a video traffic stream is a video player application on a wireless laptop that prioritizes a video conference feed from a

corporate server.

To view TSPEC client association statistics, click the TSPEC Client Associations tab.

	Packets	Bytes	Packets	Bytes	

Figure 10 - Viewing TSPEC Client Associations

The following table describes the information provided on the **TSPEC Client Association Status and Statistics** page.

Field	Description
Status	
Network	Radio interface used by the client.
Station	Client station MAC address.
TS Identifier	TSPEC Traffic Session Identifier (range 0-7).
Access Category	TS Access Category (voice or video).
Direction	The traffic direction for this TS. Direction can be: •) uplink
) downlink) bidirectional
User Priority	The User Priority (UP) for this TS. The UP is sent with each packet in the UP portion of the IP header. Typical values are:) 6 or 7 for voice) 4 or 5 for video The value may differ depending on other priority traffic sessions.
Medium Time	The time (in 32 microsecond per second units) that the TS traffic occupies the transmission medium.
Excess Usage Events	The number of times the client has exceeded the medium time established for its TSPEC. Minor, infrequent violations are ignored.
VAP	The Virtual Access Point associated with this TS client.
MAC Address	The Virtual Access Point MAC address.
SSID	The service set identifier associated with this TS client.
Statistics	
Network	Radio interface used by the client.
Station	Client station MAC address.
TS Identifier	TSPEC Traffic Session Identifier (range 0-7).
Access Category	TS Access Category (voice or video).
Direction	The traffic direction for this TS. Direction can be: •) uplink •) downlink •) bidirectional
From Station	 Shows the number of packets and bytes received from the wireless client and the number of packets and bytes that were dropped after being received. Also shows the number of packets: •) in excess of an admitted TSPEC. •) for which no TSPEC has been established when admission is required by the AP.

Field	Description
To Station	 Shows the number of packets and bytes transmitted from the AP to the wireless client and the number of packets and bytes that were dropped upon transmission. Also shows the number of packets: •) in excess of an admitted TSPEC. •) for which no TSPEC has been established when admission is required by the AP.

Table 12 - TSPEC Client Associations

Link Integrity Monitoring

The UAP provides link integrity monitoring to continually verify its connection to each associated client. To do this, the AP sends data packets to clients every few seconds when no other traffic is passing. This allows the AP to detect when a client goes out of range, even during periods when no normal traffic is exchanged. The client connection drops off the list within 300 seconds if these data packets are not acknowledged, even if no disassociation message is received.

Viewing Rogue AP Detection

The status page to view **Rogue AP Detection** information provides real-time statistics for all APs within range of the AP on which you are viewing the Administration Web pages. When AP detection is enabled, the radio will periodically switch from its operating channel to scan other channels within the same band. Click **Refresh** to update the screen and display the most current information.

The Rogue AP Detection page contains the following two lists:

- •) Detected Rogue AP List Lists all APs within range of the AP that have not been acknowledged as known APs.
- •) Known AP List Lists all APs within range of the AP that have been acknowledged as known APs either by clicking the **Grant** button associated with an AP in the Detected Rogue AP List or by appearing in an imported AP list.

To view information about other access points on the wireless network, click the Rogue AP Detection tab.

Figure 11 - Viewing Rogue and Known Access Points

You must enable the AP detection on a radio in order to collect information about other APs within range.

The following table describes the information provided on neighbouring access points.

Field	Description
AP Detection for	To allow the AP radios to perform neighbour AP detection and collect information about
Radio	neighbour APs, click Enabled .
	Io disable neighbour AP detection on the radios, click Disabled .
Detected Roque AP I	ist
Action	Click Grant to move the AP from the Detected Roque AP List to the Known AP List
	Note: The Detected Rouge AP and Known AP lists provide information. The DWL-x600AP
	does not have any control over the APs on the list and cannot apply any security policies to
	APs detected through the RF scan.
MAC	Shows the MAC address of the neighbouring AP.
Radio	The Radio field indicates which radio detected the neighbouring AP:
	•) wlan1 (Radio Two)
Beacon Int.	Shows the Beacon interval being used by this AP.
	Beacon frames are transmitted by an AP at regular intervals to announce the existence
	of the wireless network. The default behaviour is to send a beacon frame once every 100
	milliseconds (or 10 per second). The Beacon Interval is set on the Radio page (See "Modifying Radio Settings" on page
	42)
Туре	Indicates the type of device:
	•) AP indicates the neighbouring device is an AP that supports the IEEE 802.11 Wireless
	Networking Framework in Infrastructure Mode.
	hoc mode communicate with each other directly, without the use of a traditional AP.
	Ad-hoc mode is an IEEE 802.11 Wireless Networking Framework also referred to as
	peer-to-peer mode or an Independent Basic Service Set (IBSS).
SSID	The Service Set Identifier (SSID) for the AP.
	I ne SSID is an alphanumeric string of up to 32 characters that uniquely identifies a wireless
	The SSID is set on the VAP page. (See "Configuring Load Balancing" on page 64)
Privacy	Indicates whether there is any security on the neighbouring device.
	•) Off indicates that the Security mode on the neighbouring device is set to None (no
	security). •) On indicates that the neighbouring device has some security in place
	 Security is configured on the AP from the VAP page.
WPA	Indicates whether WPA security is on or off for this AP.
Band	This indicates the IEEE 802.11 mode being used on this AP. (For example, IEEE 802.11a,
	IEEE 802.11b, IEEE 802.11g.)
	The number shown indicates the mode according to the following map:
	•) 5 indicates IEEE 802.11a or 802.11n mode (or both modes)
Channel	Shows the Channel on which the AP is currently broadcasting.
	The channel defines the portion of the radio spectrum that the radio uses for transmitting
	and receiving.
Pata	Shows the rate (in mogabite per second) at which this AP is surroutly transmitting
Nate	The current rate will always be one of the rates shown in Supported Rates.
Signal	Indicates the strength of the radio signal emitting from this AP. If you hover the mouse
	pointer over the bars, a number appears and shows the strength in decibels (dB).
Beacons	Shows the total number of beacons received from this AP since it was first discovered.
Last Beacon	Shows the date and time of the last beacon received from this AP.
Rates	Shows supported and basic (advertised) rate sets for the neighbouring AP. Rates are shown
	In megabits per second (Mbps).
	Rate sets are configured on the Radio Settings page. (See "Modifying Radio Settings" on
	page 42)

Field	Description
Known AP List	
Action	An AP can appear in the Known AP List if it has been moved from the Detected Rogue AP List by clicking the Grant button or if the MAC address of the AP appears in an AP list that has been imported. To move the AP from the Known AP List to the Detected Rogue AP List, click Delete . Note: The Detected Rouge AP and Known AP lists provide information. The DWL-x600AP does not have any control over the APs on the list and cannot apply any security policies to APs detected through the RF scan.
MAC	Shows the MAC address of the neighbouring AP.
Туре	 Indicates the type of device: AP indicates the neighbouring device is an AP that supports the IEEE 802.11 Wireless Networking Framework in Infrastructure Mode. Ad hoc indicates a neighbouring station running in Ad hoc Mode. Stations set to ad hoc mode communicate with each other directly, without the use of a traditional AP. Ad-hoc mode is an IEEE 802.11 Wireless Networking Framework also referred to as <i>peer-to-peer</i> mode or an <i>Independent Basic Service Set (IBSS)</i>.
SSID	The Service Set Identifier (SSID) for the AP. The SSID is an alphanumeric string of up to 32 characters that uniquely identifies a wireless local area network. It is also referred to as the <i>Network Name</i> . The SSID is set on the VAP page. (See "Configuring Load Balancing" on page 64)
Privacy	 Indicates whether there is any security on the neighboring device. •) Off indicates that the Security mode on the neighbouring device is set to None (no security). •) On indicates that the neighbouring device has some security in place. •) Security is configured on the AP from the VAP page.
Band	 This indicates the IEEE 802.11 mode being used on this AP. (For example, IEEE 802.11a, IEEE 802.11b, IEEE 802.11g.) The number shown indicates the mode according to the following map: •) 2.4 indicates IEEE 802.11b, 802.11g, or 802.11n mode (or a combination of the modes) •) 5 indicates IEEE 802.11a or 802.11n mode (or both modes)
Channel	Shows the Channel on which the AP is currently broadcasting. The channel defines the portion of the radio spectrum that the radio uses for transmitting and receiving. The channel is set in Radio Settings. (See "Modifying Radio Settings" on page 42)

Table 13 - Rogue AP Detection

Saving and Importing the Known AP List

To save the Known AP list to a file, click **Save**. The list contains the MAC addresses of all the APs that have been added to the Known AP List. By default, the filename is *Rogue1.cfg*. You can use a text editor or Web browser to open the file and view its contents.

Use the Import feature to import a list of Known APs from a saved list. The list might be from another DWL-x600AP or created from a text file. If the MAC address of an AP appears in the Known AP List, it will not be detected as a rogue.

To import an AP List from a file, use the following steps:

- Choose whether to replace the existing Known AP list or add the entries in the imported file to the Known AP list.
 Select the **Replace** option to import the list and replace the contents of the Known AP List.
 - •) Select the **Merge** option to import the list and add the APs in the imported file to the APs currently displayed in the Known AP List.
- 2.) Click **Browse** and choose the file to import.
 - •) The file you want to import must be a plain-text file with .txt or .cfg extension. Entries in the file are MAC addresses in hexadecimal format with each octet separated by colons, for example 00:11:22:33:44:55. Separate entries with a single space. For the AP to accept the file, it must contain only MAC addresses.

3.) Click Import.

•) Once the import is completed, the screen refreshes and the MAC addresses of the APs in the imported file appear in the Known AP List.

Viewing Managed AP DHCP Information

The UAP can learn about D-Link Unified Wireless Switches on the network through DHCP responses to its initial DHCP request. The **Managed AP DHCP** page displays the DNS names or IP addresses of up to four D-Link Unified Wireless Switches that the AP learned about from a DHCP server on your network.

Figure 12 - Managed AP DHCP Information

For information about how to configure a DHCP server to respond to AP DHCP requests with the switch IP address information, see the *User Manual* for the switch.

Viewing TSPEC Status and Statistics Information

The TSPEC Status and Statistics page provides:

- •) Summary information about TSPEC sessions by radio
- •) Summary information about TSPEC sessions by VAP
- •) Real-time transmit and receive statistics for the TSPEC VAPs on all radio interfaces.

All of the transmit and receive statistics shown are totals since the AP was last started. If you reboot the AP, these figures indicate transmit and receive totals since the reboot.

To view TSPEC status and statistics, click the TSPEC Status and Statistics tab.

Figure 13 - Viewing TSPEC Status and Statistics

The following table describes the information provided on TSPEC Status and Statistics page.

Field	Description
AP and VAP Status	
Interface	Indicates the name of the Radio or VAP interface.
Access Category	Indicates Current Access Category associated with this Traffic Stream (voice or video).

Field	Description
Status	Indicates whether the TSPEC session is enabled (up) or not (down) for the corresponding Access Category. Note: This is a configuration status (does not necessarily represent the current session activity).
Active TS	Indicates the number of currently active TSPEC Traffic Streams for this radio and Access Category.
TS Clients	Indicates the number of Traffic Stream clients associated with this radio and Access Category.
Medium Time Admitted	Time (in 32 microsecond per second units) allocated for this Access Category over the transmission medium to carry data. This value should be less than or equal to the maximum bandwidth allowed over the medium for this TS.
Medium Time Unallocated	Time (in 32 microsecond per second units) of unused bandwidth for this Access Category.
Transmit and Receive	e Statistics
Total Packets	Indicates the total number of TS packets sent (in Transmit table) or received (in Received table) by this Radio for the specified Access Category.
Total Bytes	Indicates the total number of TS bytes sent (in Transmit table) or received (in Received table) by this Radio for the specified Access Category.
Total Voice Packets	Indicates the total number of TS voice packets sent (in Transmit table) or received (in Received table) by this AP for this VAP.
Total Voice Bytes	Indicates the total TS voice bytes sent (in Transmit table) or received (in Received table) by this AP for this VAP.
Total Video Packets	Indicates the total number of TS video packets sent (in Transmit table) or received (in Received table) by this AP for this VAP.
Total Video Bytes	Indicates the total TS video bytes sent (in Transmit table) or received (in Received table) by this AP for this VAP.
Total Best effort Packets	Indicates the total number of TS best effort packets sent (in Transmit table) or received (in Received table) by this AP for this VAP.
Total Best effort Bytes	Indicates the total TS best effort bytes sent (in Transmit table) or received (in Received table) by this AP for this VAP.
Total Background Packets	Indicates the total number of TS background packets sent (in Transmit table) or received (in Received table) by this AP for this VAP.
Total Background Bytes	Indicates the total TS background bytes sent (in Transmit table) or received (in Received table) by this AP for this VAP.

Table 14 - TSPEC Status and Statistics

Figure 15 - View Radio Statistics

The following table describes details about the Radio Statistics information.

Field	Description
Radio	Choose either radio 1 or radio 2 to view statistics for the selected radio
WLAN Packets Received	Total packets received by the AP on this radio interface.
WLAN Bytes Received	Total bytes received by the AP on this radio interface.
WLAN Packets Transmitted	Total packets transmitted by the AP on this radio interface.
WLAN Bytes Transmitted	Total bytes transmitted by the AP on this radio interface.
WLAN Packets Receive Dropped	Number of packets received by the AP on this radio interface that were dropped.
WLAN Bytes Receive Dropped	Number of bytes received by the AP on this radio interface that were dropped.
WLAN Packets Transmit Dropped	Number of packets transmitted by the AP on this radio interface that were dropped.
WLAN Bytes Transmit Dropped	Number of bytes transmitted by the AP on this radio interface that were dropped.

Field	Description
Fragments Received	Count of successfully received MPDU frames of type data or management.
Fragments Transmitted	Number of transmitted MPDU with an individual address or an MPDU with a multicast address of type Data or Management.
Multicast Frames Received	Count of MSDU frames received with the multicast bit set in the destination MAC address.
Multicast Frames Transmitted	Count of successfully transmitted MSDU frames where the multicast bit is set in the destination MAC address.
Duplicate Frame Count	Number of times a frame is received and the Sequence Control field indicates is a duplicate.
Failed Transmit Count	Number of times an MSDU is not transmitted successfully due to transmit attempts exceeding either the short retry limit or the long retry limit.
Transmit Retry Count	Number of times an MSDU is successfully transmitted after one or more retries.
Multiple Retry Count	Number of times an MSDU is successfully transmitted after more than one retry.
RTS Success Count	Count of CTS frames received in response to an RTS frame.
RTS Failure Count	Count of CTS frames not received in response to an RTS frame.
ACK Failure Count	Count of ACK frames not received when expected.
FCS Error Count	Count of FCS errors detected in a received MPDU frame.
Frames Transmitted	Count of each successfully transmitted MSDU.
WEP Undecryptable Count	Count of encrypted frames received and the key configuration of the transmitter indicates that the frame should not have been encrypted or that frame was discarded due to the receiving station not implementing the privacy option.

Figure 16 - Email Alert Operational Status

The following table describes details about the Email Alert Operational Status.

Field	Description	
Email Alert Status	The Email Alert operational status The status is either Up or Down . The default is Down .	
Number of Email Sent	ail The total number of email sent so far. The range is an unsigned integer of 32 bits. The default is 0.	
Number of Email Failed	The total number of email failures so far. The range is an unsigned integer of 32 bits. The default is 0.	
Time Since Last Email Sent	The time since the last email was sent. Time format is used. The default is 00 days 00 hours 00 minutes 00 seconds. The UAP uses the system time to report the information. If an email has not been sent since the device was reset, the status is not sent.	

Table 17 - Email Alert Status

Section 4 - Managing the Access Point

This section describes how to manage the UAP and contains the following subsections:

- •) "Ethernet Settings" on page 36
- •) "Wireless Settings" on page 38
- •) "Modifying Radio Settings" on page 42
- •) "Configuring Radio and VAP Scheduler" on page 47
- •) "Scheduler Association Settings" on page 49
- •) "Virtual Access Point Settings" on page 50
- •) "Configuring Wireless Multicast Forwarding" on page 59
- •) "Controlling Access by MAC Authentication" on page 63
- •) "Configuring Load Balancing" on page 64
- •) "Configuring 802.1X Authentication" on page 67
- •) "Creating a Management Access Control List (ACL)" on page 68

The configuration pages for the features in this section are located under the **Manage** heading on the Administration Web UI.

Ethernet Settings

The default wired interface settings, which include DHCP and VLAN information, might not work for all networks.

By default, the DHCP client on the UAP automatically broadcasts requests for network information. If you want to use a static IP address, you must disable the DHCP client and manually configure the IP address and other network information.

The management VLAN is VLAN 1 by default. This VLAN is also the default untagged VLAN. If you already have a management VLAN configured on your network with a different VLAN ID, you must change the VLAN ID of the management VLAN on the AP.

Management IPv6 settings describe the IPv6 configuration of Management Interface. Use this page to configure the IPv6 admin mode, IPv6 auto-config admin mode, connection type (DHCPv6 or Static IPv6 addressing) and DNS servers. By default, the DHCPv6 client on the UAP automatically broadcasts requests for network information. If you want to use a static IPv6 address, you must disable the DHCPv6 client and manually configure the Static IPv6 address and other network information.

To configure the LAN settings, click the Ethernet Settings tab.

Modify Ethernet (Wired)	settings
DNS Name	DLINK-WLAN-AP
Internal Interface Settings MAC Address	B8:A3:86:FE:1A:80
Management VLAN ID	1
Untagged VLAN	Enabled O Disabled
Untagged VLAN ID	1
Connection Type	Static IP 💌
Static IP Address	10 . 90 . 90 . 91
Subnet Mask	255 . 0 . 0 . 0
Default Gateway	10 . 90 . 90 . 254
DNS Nameservers	🔿 Dynamic 🔘 Manual

Figure 17 - Modify Ethernet (Wired) settings

The following table describes the fields to view or configure on the Ethernet Settings page.
Field	Description
Hostname	 Enter a hostname for the AP. The hostname appears in the CLI prompt. •) The hostname has the following requirements: •) The length must be between 1 – 63 characters. •) Upper and lower case characters, numbers, and hyphens are accepted. •) The first character must be a letter (a – z or A – Z), and the last character cannot be a hyphen.
MAC Address	Shows the MAC address for the LAN interface for the Ethernet port on this AP. This is a read-only field that you cannot change.
Management VLAN ID	The management VLAN is the VLAN associated with the IP address you use to access the AP. The default management VLAN ID is 1. Provide a number between 1 and 4094 for the management VLAN ID.
Untagged VLAN	If you disable the untagged VLAN, all traffic is tagged with a VLAN ID. By default all traffic on the UAP uses VLAN 1, which is the default untagged VLAN. This means that all traffic is untagged until you disable the untagged VLAN, change the untagged traffic VLAN ID, or change the VLAN ID for a VAP or client using RADIUS.
Untagged VLAN ID	Provide a number between 1 and 4094 for the untagged VLAN ID. Traffic on the VLAN that you specify in this field will not be tagged with a VLAN ID.
Connection Type	If you select DHCP , the UAP acquires its IP address, subnet mask, DNS, and gateway information from a DHCP server. If you select Static IP , you must enter information in the Static IP Address, Subnet Mask, and Default Gateway fields.
Static IP Address	Enter the static IP address in the text boxes. This field is disabled if you use DHCP as the connection type.
Subnet Mask	Enter the Subnet Mask in the text boxes.
Default Gateway	Enter the Default Gateway in the text boxes.
DNS Nameservers	Select the mode for the DNS. In Dynamic mode, the IP addresses for the DNS servers are assigned automatically via DHCP. This option is only available if you specified DHCP for the Connection Type. In Manual mode, you must assign static IP addresses to resolve domain names.
IPv6 Connection Type	If you select DHCPv6 , the UAP acquires its IPv6 address, DNS, and gateway information from a DHCPv6 server. If you select Static IPv6 , you must enter information in the Static IPv6 Address, Prefix length, and Default Gateway fields.
IPv6 Admin Mode	Enable or disable IPv6 management access to the AP
IPv6 Auto Config Admin Mode	Enable or disable IPv6 auto address configuration on the AP. When IPv6 Auto Config Mode is enabled, automatic IPv6 address configuration and gateway configuration is allowed by processing the Router Advertisements received on the LAN port. The AP can have multiple auto configured IPv6 addresses.
Static IPv6 Address	Enter a static IPv6 address. The AP can have a static IPv6 address even if addresses have already been configured automatically.
Static IPv6 Address Prefix Length	Enter the static IPv6 prefix length, which is an integer in the range of 0 – 128.
IPv6 Autoconfigured Global Addresses	If the AP has been assigned one or more IPv6 addresses automatically, the addresses are listed.
IPv6 Link Local Address	Shows the IPv6 Link Local address, which is the IPv6 address used by the local physical link. The link local address is not configurable and is assigned by using the IPv6 Neighbor Discovery process.
Default IPv6 Gateway	Enter the default IPv6 gateway.
IPv6 Domain Nameservers	Select the mode for the DNS. In Dynamic mode, the IPv6 addresses for the DNS servers are assigned automatically via DHCPv6. This option is available only if DHCPv6 is selected for the Connection Type. In Manual mode, you must assign static IPv6 addresses to resolve domain names.

Table 18 - Ethernet Settings

Note: After you configure the wired settings, you must click Apply to apply the changes and to save the settings. Changing some settings might cause the AP to stop and restart system processes. If this happens, wireless clients will temporarily lose connectivity. We recommend that you change AP settings when WLAN traffic is low.

Note: Management IPv6 is available as a separate tab in few models of DWL.

IPv6 Tunnel

The ISATAP (Intra-Site Automatic Tunnel Addressing Protocol) provides the support for encapsulating IPv6 packets within IPv4 packets to allow transmission over IPv4 networks. This feature provides AP to act as an initiator of the tunnel and will allow communication with remote IPv6 hosts. An ISATAP router acts as the end of the tunnel within the network to help AP to auto-configure ISATAP tunnel interface.

From the **IPv6 Tunnel** page, you can enable, configure, and display ISATAP global operational and configuration parameters.

IPv6 Tunnel			
ISATAP Status	O Ena	abled 🤗 Disabled	
ISATAP Capable Host	isatap		(XXX.XXX.XXX.XXX / Hostname max 253 characters, Default: isatap
ISATAP Query Interval	120	sec. (Range: 120-3600,	Default: 120)
ISATAP Solicitation Interval	120	sec. (Range: 120-3600,	Default: 120)

Click "Update" to save the new settings.			
Update			

Figure 18	Modify	IPv6	Tunnel	Settings
-----------	--------	------	--------	----------

Field	Description
ISATAP Status	Select Enable or Disable Administrative ISATAP tunnel status.
ISATAP Capable Host	Specify the IP Address or DNS name of the ISATAP router. The default value is isatap.
ISATAP Query Interval	The number of seconds from 120-3600 between DNS queries (before the IP address of the ISATAP router is known) for this tunnel. The interval can be a default value (120 seconds) or a user defined interval.
ISATAP Solicitation Interval	The number of seconds from 120-3600 between ISATAP router solicitations messages, when there is no active ISATAP router. The interval can be the default value (120 seconds) or a user defined interval.
ISATAP IPv6 Link Local Address	Displays link-local IPv6 address of ISATAP interface.
ISATAP IPv6 Global Address	Displays global IPv6 address of ISATAP interface.

Table 19 - IPv6 Tunnel Settings

Wireless Settings

Wireless settings describe aspects of the local area network (LAN) related specifically to the radio device in the access point (802.11 Mode and Channel) and to the network interface to the access point (MAC address for access

point and Wireless Network name, also known as SSID).

To configure the wireless interface, click the **Manage > Wireless Settings** tab.

Modify wireless settings	
802.11d Regulatory Domain Support	Enabled O Disabled

Figure 19 - Modify Wireless Settings

The following table describes the fields and configuration options available on the **Wireless Settings** page.

Field	Description
Country	Select the country in which the AP is operating. Wireless regulations vary from country to country. Make sure you select the correct country code so that the AP complies with the regulations in your country. The country code selection affects the radio modes the AP can support as well as the list of channels and transmission power of the radio.
TSPEC Violation Interval	Specify the time interval (in seconds) for the AP to report (through the system log and SNMP traps) associated clients that do not adhere to mandatory admission control procedures.
Radio Interface	Specify whether you want the radio interface on or off.
MAC Address	Indicates the Media Access Control (MAC) addresses for the interface. Dual-radio APs have a unique MAC address for each radio. A MAC address is a permanent, unique hardware address for any device that represents an interface to the network. The MAC address is assigned by the manufacturer. You cannot change the MAC address. It is provided here for informational purposes as a unique identifier for an interface.

Field	Description
Field Mode	 Description The Mode defines the Physical Layer (PHY) standard the radio uses. Note: The modes available depend on the country code setting and the radio selected. Select one of the following modes for radio 1: IEEE 802.11a is a PHY standard that specifies operating in the 5 GHz U-NII band using orthogonal frequency division multiplexing (OFDM). It supports data rates ranging from 6 to 54 Mbps. IEEE 802.11a/n operates in the 5 GHz ISM band and includes support for both 802.11a and 802.11n devices. IEEE 802.11n is an extension of the 802.11 standard that includes multiple-input multiple-output (MIMO) technology. IEEE 802.11n supports data ranges of up to 248 Mbps and nearly twice the indoor range of 802.11 b, 802.11g, and 802.11a. 5 GHz IEEE 802.11n is the recommended mode for networks with 802.11n devices. IEEE 802.11n is the recommended mode for networks with 802.11n devices. IEEE 802.11n can achieve a higher throughput when it does not need to be compatible with legacy devices (802.11a). Select one of the following modes for radio 2: IEEE 802.11b/g operates in the 2.4 GHz ISM band. IEEE 802.11b is an enhancement of the initial 802.11 PHY to include 5.5 Mbps and 11 Mbps data rates. It uses direct sequence spread spectrum (DSSS) or frequency hopping spread spectrum (FHSS) as well as complementary code keying (CCK) to provide the higher data rates. It supports data rates ranging from 1 to 11 Mbps. IEEE 802.11g is a higher speed extension (up to 54 Mbps) to the 802.11b PHY. It uses orthogonal frequency division multiplexing (OFDM). It supports data rates ranging from 1 to 54 Mbps. IEEE 802.11b/g/n operates in the 2.4 GHz ISM band and includes support for 802.11b, 802.11g, and 802.11n devices.
	 GHz frequency can connect to the AP. •) IEEE 802.11n/ac: 802.11n clients and 802.11ac clients operating in the 5-GHz frequency can connect to the AP.
Channel	Trequency can connect to the AP. Select the Channel . The range of available channels is determined by the mode of the radio interface and the country code setting. If you select Auto for the channel setting, the AP scans available channels and selects a channel where no traffic is detected. The Channel defines the portion of the radio spectrum the radio uses for transmitting and receiving. Each mode offers a number of channels, depending on how the spectrum is licensed by national and transnational authorities such as the Federal Communications Commission (FCC) or the International Telecommunication Union (ITU-R). When automatic channel assignment is enabled on the Channel Management page for Clustering, the channel policy for the radio is automatically set to static mode, and the Auto option is not available for the Channel field. This allows the automatic channel feature to set the channels for the radios in the cluster.
Station Isolation	To enable Station Isolation, select the check box directly beside it. When Station Isolation is disabled, wireless clients can communicate with one another normally by sending traffic through the AP. When Station Isolation is enabled, the AP blocks communication between wireless clients on the same radio and VAP. The AP still allows data traffic between its wireless clients and wired devices on the network, across a WDS link, and with other wireless clients associated with a different VAP, but not among wireless clients associated with the same VAP.

Field	Description
AeroScout™ Engine Protocol Support	AeroScout Engine support provides location-based services for wireless networks. Specify whether to enable support for the AeroScout protocol. Options are Enabled or Disabled . The default is Disabled . When enabled, Aeroscout devices are recognized and data is sent to an Aeroscout Engine (AE) for analysis. The AE determines the geographical location of 802.11 capable devices, such as STAs, APs, and AeroScout's line of 802.11 enabled RFID devices, or tags. The AE communicates with APs that support the AE protocol in order to collect information about the RF devices detected by the APs. Using the AE protocol, D-Link supports direct communication between AE and the APs. When operating in managed mode, the AE is configured with the IP address of the managed access points from which it collects information. The Wireless Switch cannot communicate with the AE.
	 Note: Only AeroScout tag hardware of types T2 and T3 are explicitly supported. Other tag models are also supported only if their implementation of the AeroScout protocol conforms to the AeroScout Engine - Access Point Interface Specification, version 2.1. Note: AeroScout tags operate only in 802.11 b/g mode. Therefore, network administrators who use the AeroScout tags must configure at least one radio on APs that are expected to detect tags in either 802.11b/g or 802.11b/g/n mode. The radios configured in 2.4 GHz IEEE 802.11 mode or any of the 5GHz modes cannot detect AeroScout tags. Note: The AE protocol allows access points to mark detected APs as rogue devices. The D-Link APs do not support this feature and never report detected APs as rogues.

Table 20 - Wireless Settings

Note: After you configure the wireless settings, you must click Apply to apply the changes and to save the settings. Changing some settings might cause the AP to stop and restart system processes. If this happens, wireless clients will temporarily lose connectivity. We recommend that you change AP settings when WLAN traffic is low.

Using the 802.11h Wireless Mode

For 802.11a radios, if the regulatory domain requires radar detection on the channel, the Dynamic Frequency Selection (DFS) and Transmit Power Control (TPC) features of 802.11h are automatically activated.

There are a number of key points about the IEEE 802.11h standard:

- •) 802.11h only works for the 802.11a band. It is not required for 802.11b or 802.11g.
- •) If you are operating in an 802.11h enabled domain, the AP attempts to use the channel you assign. If the channel has been blocked by a previous radar detection, or if the AP detects a radar on the channel, then the AP automatically selects a different channel.
- •) When 802.11h is enabled, the AP will not be operational in the 5GHz band for at least 60 seconds due to radar scanning.
- •) Setting up WDS links may be difficult when 802.11h is operational. This is because the operating channels of the two APs on the WDS link may keep changing depending on channel usage and radar interference. WDS will only work if both the APs operate on the same channel. For more information on WDS, see "Configuring Load Balancing" on page 64.

Enabling AeroScout[™] Engine Support

The AeroScout Engine (AE) is a software platform produced by AeroScout Inc. for location-based services. The AE can determine the physical location of 802.11 capable AeroScout devices. The AE communicates with APs that have the AE protocol enabled in order to collect information about the RF devices detected by the APs.

The DWS-4000 Series switch supports only direct communication between the AE and the APs. When operating in managed mode, the AE is configured with the IP address of the managed access points from which it collects

information. The DWS-4000 Series switch does not communicate with the AE.

AeroScout tags operate only in 802.11b/g mode. Therefore, network administrators who use the AeroScout tags must configure at least one radio on APs that are expected to detect tags in either 802.11b/g or 802.11b/g/n mode. The radios configured in 2.4 GHz IEEE 802.11n mode cannot detect AeroScout tags.

 Note: The following notes apply to AeroScout product and protocol support:) D-Link does not sell AeroScout products. Contact AeroScout for AeroScout hardware, software or deployment information.) The AE protocol does not support any authentication or encryption between the AE server and the access point.) The AE protocol requires radios to operate in promiscuous mode. This means that the AP
receives and processes all packets detected by the radios, as opposed to processing only packets destined to the APs BSSID. This can affect AP throughput.

Modifying Radio Settings

Radio settings directly control the behaviour of the radio devices in the AP and its interaction with the physical medium; that is, how and what type of electromagnetic waves the AP emits.

To specify radio settings, click the Radio tab in the Manage section.

Different settings will be displayed depending on the mode you select. All settings are described in the table below.

Modify radio settings	
	Radio 1 🔻
51	stus 🖲 On 🖯 Off
Mode	IEEE 802.11a/n -
Channel	Auto 👻
Short Guard Interval Supported	Yes 🔻
Protection	Auto 🝷
Beacon Interval	100 (Nsec, Range: 20 - 2000)
DTIM Period	2 (Range: 1-255)
Fragmentation Threshold	2346 (Range: 256-2346, Even Numbers)
RTS Threshold	2347 (Range: 0-2347)
Naximum Stations	200 (Ranger 0-200)
Transmit Power	100 (Percent, Range: 1 - 100)
Fixed Multicast Rate	Auto 💌 Mbps
	Rate Supported Basic
	40 Mbos
	36 Mbos
Rate Sets	24 Mbps 🔍 🔍

Figure 20 - Modify Radio Settings

The following table describes the fields and configuration options for the Radio Settings page.

RadioSelect Radio 1or Radio 2 to specify which radio to configure. The rest of the settings on this page apply to the radio you select in this field. Be sure to configure settings for both radios. Radio 1 operates in the 5 GHz band (802.11a/n), and Radio 2 operates in the 2.4 GHz band (802.11b/g/n).Status (On/Off)Specify whether you want the radio on or off by clicking On or Off. If you turn off a radio, the AP sends disassociation frames to all the wireless clients it is currently supporting so that the radio can be gracefully shutdown and the clients can start the association process with other available APs.	Field	Description
Status (On/Off)Specify whether you want the radio on or off by clicking On or Off. If you turn off a radio, the AP sends disassociation frames to all the wireless clients it is currently supporting so that the radio can be gracefully shutdown and the clients can start the association process with other available APs.	Radio	Select Radio 1or Radio 2 to specify which radio to configure. The rest of the settings on this page apply to the radio you select in this field. Be sure to configure settings for both radios. Radio 1 operates in the 5 GHz band (802.11a/n), and Radio 2 operates in the 2.4 GHz band (802.11b/g/n).
	Status (On/Off)	Specify whether you want the radio on or off by clicking On or Off . If you turn off a radio, the AP sends disassociation frames to all the wireless clients it is currently supporting so that the radio can be gracefully shutdown and the clients can start the association process with other available APs.

Field	Description
Field Mode	 Description The Mode defines the Physical Layer (PHY) standard the radio uses. Note: The modes available depend on the country code setting and the radio selected. Select one of the following modes for radio 1: IEEE 802.11a is a PHY standard that specifies operating in the 5 GHz U-NII band using orthogonal frequency division multiplexing (OFDM). It supports data rates ranging from 6 to 54 Mbps. IEEE 802.11a/n operates in the 5 GHz ISM band and includes support for both 802.11a and 802.11n devices. IEEE 802.11n is an extension of the 802.11 standard that includes multiple-input multiple-output (MIMO) technology. IEEE 802.11n supports data ranges of up to 248 Mbps and nearly twice the indoor range of 802.11 b, 802.11g, and 802.11a. 5 GHz IEEE 802.11n is the recommended mode for networks with 802.11n devices. IEEE 802.11n can achieve a higher throughput when it does not need to be compatible with legacy devices (802.11a). Select one of the following modes for radio 2: IEEE 802.11b/g operates in the 2.4 GHz ISM band. IEEE 802.11b is an enhancement of the initial 802.11 performance of the solution (DCK) to provide the higher data rates. It supports data rates ranging from 1 to 11 Mbps. IEEE 802.11b is an enhancement of the somplementary code keying (CCK) to provide the higher data rates. It supports data rates ranging from 1 to 11 Mbps. IEEE 802.11b, and 802.11n devices. IEEE 802.11b/g/n operates in the 2.4 GHz ISM band and includes support for 802.11b, 802.11g, and 802.11n devices. 2.4 GHz IEEE 802.11n is the recommended mode for networks with 802.11n devices that operate in the 2.4 GHz ISM band and includes support for 802.11b, 802.11g, and 802.11n devices. IEEE 802.11b/g/n operates in the 2.4 GHz ISM band. IEEE 802.11g is a higher speed extension (up to 54 Mbps) to the 802.11b PHY. It uses orthogonal frequency division multiplexing (OFDM). It supports data rates ranging from 1 to 54 Mbps. <
Channel	Select the Channel . The range of available channels is determined by the mode of the radio interface and the country code setting. If you select Auto for the channel setting, the AP scans available channels and selects a channel where no traffic is detected. The channel defines the portion of the radio spectrum the radio uses for transmitting and receiving. Each mode offers a number of channels, depending on how the spectrum is licensed by national and transnational authorities such as the Federal Communications Commission (FCC) or the International Telecommunication Union (ITU-R). When automatic channel assignment is enabled on the Channel Management page for Clustering, the channel policy for the radio is automatically set to static mode, and the Auto option is not available for the Channel field. This allows the automatic channel feature to set the channels for the radios in the cluster.
Channel Bandwidth (802.11n and 802.11ac modes only)	The 802.11n specification allows a 40 MHz wide channel in addition to the legacy 20 MHz channel available with other modes. The 40 MHz channel enables higher data rates but leaves fewer channels available for use by other 2.4 GHz and 5 GHz devices. The 802.11ac specification allows an 80 MHz -wide channel in addition to the 20 MHz and 40 MHz channels. Set the field to 20 MHz to restrict the use of the channel bandwidth to a 20 MHz channel. For the 802.11ac mode, set the field to 40 MHz to prevent the radio from using the 80 MHz channel bandwidth.

Field	Description
Primary Channel (802.11n modes only)	 This setting can be changed only when the channel bandwidth is set to 40 MHz. A 40 MHz channel can be considered to consist of two 20 MHz channels that are contiguous in the frequency domain. These two 20 MHz channels are often referred to as the Primary and Secondary channels. The Primary Channel is used for 802.11n clients that support only a 20 MHz channel bandwidth and for legacy clients. Select one of the following options: Lower — Set the Primary Channel as the lower 20 MHz channel in the 40 MHz band. Upper — Set the Primary Channel as the upper 20 MHz channel in the 40 MHz band.
DFS Support	This field is available only if the selected radio mode operates in the 5 GHz frequency. For radios in the 5 GHz band, when DFS support is on and the regulatory domain requires radar detection on the channel, the Dynamic Frequency Selection (DFS) and Transmit Power Control (TPC) features of 802.11h are activated. DFS is a mechanism that requires wireless devices to share spectrum and avoid co-channel operation with radar systems in the 5 GHz band. DFS requirements vary based on the regulatory domain, which is determined by the country code setting of the AP.
Short Guard Interval Supported	 This field is available only if the selected radio mode includes 802.11n. The guard interval is the dead time, in nanoseconds, between OFDM symbols. The guard interval prevents Inter-Symbol and Inter-Carrier Interference (ISI, ICI). The 802.11n mode allows for a reduction in this guard interval from the a and g definition of 800 nanoseconds to 400 nanoseconds. Reducing the guard interval can yield a 10% improvement in data throughput. Select one of the following options: Yes — The AP transmits data using a 400ns guard Interval when communicating with clients that also support the short guard interval. No — The AP transmits data using an 800ns guard interval.
Multidomain Regulatory Mode	This feature is configurable on a per radio basis. By default, it is enabled. Multidomain Regulatory Mode (World Mode) causes the AP to broadcast which country it is operating in as a part of its beacons and probe responses. This allows client stations to operate in any country without re-configuration. Disabling this feature prevents the country code setting from being broadcast in the beacons. However, this only applies to radios configured to operate in the g band (2.4 GHz band). For radios operating in the a band (5 GHz band), the AP software configures support for 802.11h. When 802.11h is supported, the country code information is broadcast in the beacons. To enable Multidomain Regulatory Mode support, click Enabled . To disable Multidomain Regulatory Mode support, click Disabled .
STBC Mode	 This field is available only if the selected radio mode includes 802.11n. Space Time Block Coding (STBC) is an 802.11n technique intended to improve the reliability of data transmissions. The data stream is transmitted on multiple antennas so the receiving system has a better chance of detecting at least one of the data streams. Select one of the following options: On — The AP transmits the same data stream on multiple antennas at the same time. Off — The AP does not transmits the same data on multiple antennas.
Protection	The protection feature contains rules to guarantee that 802.11n transmissions do not cause interference with legacy stations or APs. By default, these protection mechanisms are enabled (Auto). With protection enabled, protection mechanisms will be invoked if legacy devices are within range of the AP. This causes more overhead on every transmission, which will impact performance. However, there is no impact on performance if there are no legacy devices within range of the AP. You can disable (Off) these protection mechanisms; however, when 802.11n protection is off, legacy clients or APs within range can be affected by 802.11n transmissions. The 802.11 protection feature is also available when the mode is 802.11b/g. When protection is enabled in this mode, it protects 802.11b clients and APs from 802.11g transmissions. Note: This setting does not affect the ability of the client to associate with the AP.
Beacon Interval	Beacon frames are transmitted by an AP at regular intervals to announce the existence of the wireless network. The default behaviour is to send a beacon frame once every 100 milliseconds (or 10 per second). Enter a value from 20 to 2000 milliseconds.

Field	Description
DTIM Period	Specify a DTIM period from 1 to 255 beacons. The Delivery Traffic Information Map (DTIM) message is an element included in some Beacon frames. It indicates which client stations, currently sleeping in low-power mode, have data buffered on the AP awaiting pick-up. The DTIM period you specify indicates how often the clients served by this AP should check for buffered data still on the AP awaiting pickup. The measurement is in beacons. For example, if you set this field to 1, clients will check for buffered data on the AP at every beacon. If you set this field to 10, clients will check on every 10th beacon.
Fragmentation Threshold	Specify a number between 256 and 2,346 to set the frame size threshold in bytes. The fragmentation threshold is a way of limiting the size of packets (frames) transmitted over the network. If a packet exceeds the fragmentation threshold you set, the fragmentation function is activated and the packet is sent as multiple 802.11 frames. If the packet being transmitted is equal to or less than the threshold, fragmentation is not used. Setting the threshold to the largest value (2,346 bytes) effectively disables fragmentation. Fragmentation plays no role when Aggregation is enabled. Fragmentation involves more overhead both because of the extra work of dividing up and reassembling of frames it requires, and because it increases message traffic on the network. However, fragmentation can help improve network performance and reliability if properly configured. Sending smaller frames (by using lower fragmentation threshold) might help with some interference problems; for example, with microwave ovens. By default, fragmentation is off. We recommend not using fragmentation unless you suspect radio interference. The additional headers applied to each fragment increase the overhead on the network and can greatly reduce throughput
RTS Threshold	Specify a Request to Send (RTS) Threshold value between 0 and 2347. The RTS threshold indicates the number of octets in an MPDU, below which an RTS/CTS handshake is not performed. Changing the RTS threshold can help control traffic flow through the AP, especially one with a lot of clients. If you specify a low threshold value, RTS packets will be sent more frequently. This will consume more bandwidth and reduce the throughput of the packet. On the other hand, sending more RTS packets can help the network recover from interference or collisions which might occur on a busy network, or on a network experiencing electromagnetic interference.
Maximum Stations	Specify the maximum number of stations allowed to access this AP at any one time. You can enter a value between 0 and 200.
Transmit Power	Enter a percentage value for the transmit power level for this AP. The default value, which is 100% , can be more cost-efficient than a lower percentage since it gives the AP a maximum broadcast range and reduces the number of APs needed. To increase capacity of the network, place APs closer together and reduce the value of the transmit power. This helps reduce overlap and interference among APs. A lower transmit power setting can also keep your network more secure because weaker wireless signals are less likely to propagate outside of the physical location of your network.
Fixed Multicast Rate	Select the multicast traffic transmission rate you want the AP to support.
Frame-burst Support	Frame-burst Support boosts up the downstream throughput.
Legacy Rate Sets	 Check the transmission rate sets you want the AP to support and the basic rate sets you want the AP to advertise: •) Rates are expressed in megabits per second. •) Supported Rate Sets indicate rates that the AP supports. You can check multiple rates (click a check box to select or de-select a rate). The AP will automatically choose the most efficient rate based on factors like error rates and distance of client stations from the AP. •) Basic Rate Sets indicate rates that the AP will advertise to the network for the purposes of setting up communication with other APs and client stations on the network. It is generally more efficient to have an AP broadcast a subset of its supported rate sets.

Field	Description
MCS (Data Rate) Settings (802.11n modes only)	This field shows the Modulation and Coding Scheme (MCS) index values supported by the radio. Each index can be enabled and disabled independently.
Broadcast/Multicast Rate Limiting	 Enabling multicast and broadcast rate limiting can improve overall network performance by limiting the number of packets transmitted across the network. By default the Multicast/Broadcast Rate Limiting option is disabled. Until you enable Multicast/Broadcast Rate Limiting, the following fields will be disabled: •) Rate Limit - Enter the rate limit you want to set for multicast and broadcast traffic. The limit should be greater than 1, but less than 50 packets per second. Any traffic that falls below this rate limit will always conform and be transmitted to the appropriate destination. The default and maximum rate limit setting is 50 packets per second. •) Rate Limit Burst - Setting a rate limit burst determines how much traffic bursts can be before all traffic exceeds the rate limit. This burst limit allows intermittent bursts of traffic on a network above the set rate limit. The default and maximum rate limit setting is 75 packets per second.
DHCP Offer/ACK to Unicast	Enabling this feature will convert BOOTP replies from DHCP server to Unicast and send to the requesting wireless client.
Multicast to Unicast	Enabling this feature will convert all multicast data stream to unicast stream and send to the associated wireless clients.
Forced Roaming	Enabling this feature will detect and disconnect wireless clients based on the client RSSI. If the client RSSI falls below the roaming threshold value, the client will be disassociated. Further association attempts will be monitored and disconnected 3 times if its RSSI is below the threshold value. If still the client tries association 4th time, the association will be logged and allowed to connect.
TSPEC Mode	 Regulates the overall TSPEC mode on the AP. The options are: •) On — The AP handles TSPEC requests according to the TSPEC settings you configure on the Radio page. Use this setting if the AP handles traffic from QoS-capable devices, such as a Wi-Fi CERTIFIED phone. •) Off — The AP ignores TSPEC requests from client stations. Use this setting if you do not want to use TSPEC to give QoS-capable devices priority for time-sensitive traffic.
TSPEC Voice ACM Mode	 Regulates mandatory admission control (ACM) for the voice access category. The options are: •) On — A station is required to send a TSPEC request for bandwidth to the AP before sending or receiving a voice traffic stream. The AP responds with the result of the request, which includes the allotted medium time if the TSPEC was admitted. •) Off — A station can send and receive voice priority traffic without requiring an admitted TSPEC; the AP ignores voice TSPEC requests from client stations.
TSPEC Voice ACM Limit	Specify an upper limit on the amount of traffic the AP attempts to transmit on the wireless medium using a voice AC to gain access.
TSPEC Video ACM Mode	 Regulates mandatory admission control for the video access category. The options are: •) On — A station is required to send a TSPEC request for bandwidth to the AP before sending or receiving a video traffic stream. The AP responds with the result of the request, which includes the allotted medium time if the TSPEC was admitted. •) Off — A station can send and receive video priority traffic without requiring an admitted TSPEC; the AP ignores video TSPEC requests from client stations.
TSPEC Video ACM Limit	Specify an upper limit on the amount of traffic the AP attempts to transmit on the wireless medium using a video AC to gain access.
TSPEC BE ACM Mode	 Regulates mandatory admission control for the best effort access category. The options are: On-A station is required to send a TSPEC request for bandwidth to the AP before sending or receiving a best effort traffic stream. The AP responds with the result of the request, which includes the allotted medium time if the TSPEC was admitted. Off-A station can send and receive best effort priority traffic without requiring an admitted TSPEC; the AP ignores best effort TSPEC requests from client stations.
TSPEC BE ACM Limit	Specify an upper limit on the amount of traffic the AP attempts to transmit on the wireless medium using a best effort AC for stations roamed to this AP using Fast BSS Transition

Field	Description
TSPEC BK ACM Mode	 Regulates mandatory admission control for the background access category. The options are: On-A station is required to send a TSPEC request for bandwidth to the AP before sending or receiving a background traffic stream. The AP responds with the result of the request, which includes the allotted medium time if the TSPEC was admitted. Off-A station can send and receive background priority traffic without requiring an admitted TSPEC; the AP ignores background TSPEC requests from client stations.
TSPEC BK ACM Limit	Specify an upper limit on the amount of traffic the AP attempts to transmit on the wireless medium using a background AC for stations roamed to this AP using Fast BSS Transition.
TSPEC AP Inactivity Timeout	Specify the amount of time for an AP to detect an downlink TS as idle before deleting it.
TSPEC Station Inactivity Timeout	Specify the amount of time for an AP to detect an uplink TS as idle before deleting it.
TSPEC Legacy WMM Queue Map Mode	Select Enable to allow intermixing of legacy traffic on queues operating as ACM.
Vht Features	The purpose of this feature is to enable/disable Broadcom specific extensions in VHT for Broadcom-to-Broadcom links. VHT feature enables support for 256QAM VHT rates not specified by the 802.11ac Draft. The rates are all VHT LDPC mode, MCS 9 Nss 1 20Mhz, MCS 9 Nss 2 20Mhz, MCS 6 Nss 3 80Mhz. The vht feature is supported for 802.11ac phy.
Olpc Calibration Period	The purpose of this is to set Olpc Calibration Period which triggers a periodic calibration to maintain output power same as target power for low power channels. The range of Olpc Calibration Period is 10 to 20 minutes and '0' is to disable the periodic calibration. This is supported on 43431, 43460, and 43520 Radios.
Airtime Fairness	The purpose of this is to enable/disable Airtime Fairness. This feature addresses the issue of slower data transfers throttling the higher speed ones.

Table 21 - Radio Settings

Note: It is recommended not to require Admission Control for the access categories BE (Best Effort) and BK (Background). Changing some settings might cause the AP to stop and restart system processes. If this happens, wireless clients will temporarily lose connectivity. We recommend that you change AP settings when WLAN traffic is low.
Note: The following features are available only in DWL-3610AP and DWL-6610B1AP: DFS

Use the **Radio** page to configure both Radio One and Radio Two. The settings on the page apply only to the radio that you choose from the Radio drop-down list. After you configure settings for one of the radios, click **Apply** and then select and configure the other radio. Be sure to click **Apply** to apply the second set of configuration settings for the other radio.

Configuring Radio and VAP Scheduler

The Radio and VAP scheduler is a standalone DWL-x600AP feature. To configure the Radio and VAP scheduler, select the **Scheduler** tab in the **Manage** section. The Radio and VAP Scheduler allows you to configure a rule with a specific time interval for VAPs or radios to be operational, thereby automating the enabling or disabling of the VAPs and Radios.

One of the ways you can use this feature is to schedule radios to operate only during the office working hours in order to achieve security and reduce power consumption. You can also use the Scheduler to allow access to VAPs for wireless clients only during specific times of day.

Each rule specifies the start time, end time and day (or days) of the week the radio or VAP can be operational. The rules are periodic in nature and are repeated every week.

A valid rule must contain all of the following parameters:

- •) Days of the Week.
- •) Start Time (hour and minutes).
- •) End Time (hour and minutes).

Only valid rules are added to the profile. Up to 16 rules are grouped together to form a scheduling profile. Any two periodic rules time entries belonging to the same profile must not overlap. The time granularity for the schedules is one minute. The DWL-x600AP supports up to 16 profiles.

Figure 21 - Scheduler Configuration

Field	Description				
Global Scheduler Mode	A global switch to enable or disable the scheduler feature. The default is Disable .				
Scheduler Operation	al Status				
Status	The operational status of the Scheduler. The range is Up or Down . The default is Down .				
Reason	 Provides additional information about the status. The reason can be one or more of the following: IsActive – Operational status is up. ConfigDown – Operational status is down because global configuration is disabled. TimeNotSet – Operational status is down because the AP time has not been set, either manually or by specifying an NTP server to use. ManagedMode– Operational status is down because the AP is in managed mode. 				
Scheduler Profile	The Scheduler profile defines the list of profiles names that can be associated to the VAP or Radio configuration. Rules are associated with a named scheduler profile. You can define up to 16 scheduler profile names. By default, no profiles are created. The profile name can be up to 32 alphanumeric characters. Click Add to add the profile name.				
Rule Configuration	Each scheduler profile may have up to 16 periodic rules. The list of parameters for each periodic rule are described below.				
Select Profile	Select the profile name from the menu.				
Set Schedule	The day of the week. Range is: Daily , Weekday (Monday to Friday), Weekend (Saturday and Sunday), Monday , Tuesday , Wednesday , Thursday , Friday , Saturday , Sunday . The default is Daily .				
Start Time	The time when the radio or VAP will be operationally enabled. The time is in HH:MM 24-hour format. The range is <00-23>:<00-59>. The default is 00:00.				
End Time	The time when the radio or VAP will be operationally disabled. The time is in HH:MM 24-hour format. The range is <00-23>:<00-59>. The default is 00:00.				

Table 22 - Scheduler Configuration

After you select a profile from the **Select Profile** field, the rules that have been added to the selected profile appear in the table below the *Rule Configuration* area. When you add a new rule to a profile, it appears in the table. Use the

Modify Rule and Remove Rule buttons to manage the rules associated with a profile.

Use the following buttons to perform their respective tasks:

- •) Add: To add a scheduler profile, specify the name of the profile in the appropriate field and click Add.
- •) **Remove**: To remove a scheduler profile, select it from the Select Profile field in the Rule Configuration table and click **Remove**.
- •) Add Rule: After you configure the rule settings, click Add Rule to add the rule to the selected profile.
- Modify Rule: To change an existing rule, select the rule, update the values in the Rule Configuration area, and click Modify Rule.
- •) Remove Rule: To delete a rule from a profile, select the rule and click Remove Rule.
- •) Apply: After making any modifications to the rules, click Apply to apply the changes and to save the settings.

Figure 22 - Scheduler Configuration (Modify Rule)

Click **Apply** to save the new configuration settings.

Note: After making any modifications, you must click **Apply** to apply the changes and to save the settings.

Scheduler Association Settings

For a Scheduler profile to take effect, you must associate it with at least one radio or VAP interface. To associate the Scheduler profiles, select the **Scheduler Association** tab in the **Manage** section. By default, there are no Scheduler profiles created, so no profile is associated to any radio or VAP. The Scheduler profile needs to be explicitly associated to a radio or VAP configuration. Only one Scheduler profile can be associated to any radio or VAPs. If the Scheduler profile associated with a VAP or radio is deleted, then the associated profile to the VAP or radio is removed implicitly. If the radio is operationally disabled, then all the VAPs associated to that radio are also operationally disabled irrespective of the VAP configuration.

Radio Sched	duler Profile	Operational Status

Field	Description				
Radio Scheduler Profile Operational Status					
1 or 2	From the menu, select the Scheduler profile to associate with Radio 1 or Radio 2.				
Scheduler Profile	From the menu, select the Scheduler profile to associate with the Radio.				
Status	The operational status of the Scheduler, which is either Up or Down .				
VAP Scheduler Profile Operational Status					
Radio	From the menu, select Radio 1 or Radio 2 to associate the VAP Scheduler Profile.				
VAP	Identifies the VAP associated with the rest of the information in the row.				
0-15 or Scheduler Profile	From the menu, select the Scheduler profile to associate with the respective VAP.				
Operational Status	The operational status of the Scheduler. The range is Up or Down .				

Table 23 - Scheduler Association Settings

Note: After you associate a Scheduler profile with a Radio interface or a VAP interface, you must click **Apply** to apply the changes and to save the settings.

Virtual Access Point Settings

To change VAP 0 or to enable and configure additional VAPs, select the VAP tab in the Manage section.

VAPs segment the wireless LAN into multiple broadcast domains that are the wireless equivalent of Ethernet VLANs. VAPs simulate multiple APs in one physical AP. Each radio supports up to 16 VAPs.

For each VAP, you can customize the security mode to control wireless client access. Each VAP can also have a unique SSID. Multiple SSIDs make a single AP look like two or more APs to other systems on the network. By configuring VAPs, you can maintain better control over broadcast and multicast traffic, which affects network performance.

You can configure each VAP to use a different VLAN, or you can configure multiple VAPs to use the same VLAN, whether the VLAN is on the same radio or on a different radio. VAP0, which is always enabled on both radios, is assigned to the default VLAN 1.

The AP adds VLAN ID tags to wireless client traffic based on the VLAN ID you configure on the VAP page or by using the RADIUS server assignment. If you use an external RADIUS server, you can configure multiple VLANs on each VAP. The external RADIUS server assigns wireless clients to the VLAN when the clients associate and authenticate.

You can configure up to four global IPv4 or IPv6 RADIUS servers. One of the servers always acts as a primary while the others act as backup servers. The network type (IPv4 or IPv6) and accounting mode are common across all configured RADIUS servers. You can configure each VAP to use the global RADIUS server settings, which is the default, or you can configure a per-VAP RADIUS server set. You can also configure separate RADIUS server settings for each VAP. For example, you can configure one VAP to use an IPv6 RADIUS server while other VAPs use the global IPv4 RADIUS server settings you configure.

If wireless clients use a security mode that does not communicate with the RADIUS server, or if the RADIUS server does not provide the VLAN information, you can assign a VLAN ID to each VAP. The AP assigns the VLAN to all wireless clients that connect to the AP through that VAP.

Note: Before you configure VLANs on the AP, be sure to verify that the switch and DHCP server the AP uses can support IEEE 802.1Q VLAN encapsulation.

To set up multiple VAPs, click Manage > VAP.

Figure 24 - Modify Virtual Access Point Settings

The following table describes the fields and configuration options on the VAP page.

Field	Description
RADIUS IP Address Type	Specify the IP version that the RADIUS server uses. You can toggle between the address types to configure IPv4 and IPv6 global RADIUS address settings, but the AP contacts only the RADIUS server or servers for the address type you select in this field.
RADIUS IP Address	Enter the IPv4 or IPv6 address for the primary global RADIUS server. By default, each VAP uses the global RADIUS settings that you define for the AP at the top of the VAP page.
RADIUS IPv6 Address	When the first wireless client tries to authenticate with the AP, the AP sends an authentication request to the primary server. If the primary server responds to the authentication request, the AP continues to use this RADIUS server as the primary server, and authentication requests are sent to the address you specify. If the IPv4 RADIUS IP Address Type option is selected in the previous field, enter the IP address of the RADIUS server that all VAPs use by default, for example 192.168.10.23. If the IPv6 RADIUS IP Address Type option is selected, enter the IPv6 address of the primary global RADIUS server, for example 2001:0db8:1234::abcd.

Field	Description
RADIUS IP or IPv6 Address 1–3	Enter up to three IPv4 or IPv6 addresses to use as the backup RADIUS servers. The field label is RADIUS IP Address when the IPv4 RADIUS IP Address Type option is selected and RADIUS IPv6 Address when the IPv6 RADIUS IP Address Type option is selected. If authentication fails with the primary server, each configured backup server is tried in sequence. The IPv4 or IPv6 address must be valid in order for the AP to attempt to contact the server.
RADIUS Key	Enter the RADIUS key in the text box. The <i>RADIUS Key</i> is the shared secret key for the global RADIUS server. You can use up to 63 standard alphanumeric and special characters. The key is case sensitive, and you must configure the same key on the AP and on your RADIUS server. The text you enter will be displayed as "*" characters to prevent others from seeing the RADIUS key as you type.
RADIUS Key 1–3	Enter the RADIUS key associated with the configured backup RADIUS servers. The server at RADIUS IP Address-1 uses RADIUS Key-1, RADIUS IP Address-2 uses RADIUS Key-2, and so on.
Enable RADIUS Accounting	Select this option to track and measure the resources a particular user has consumed such as system time, amount of data transmitted and received, and so on. If you enable RADIUS accounting, it is enabled for the primary RADIUS server and all backup servers.
Enable RADIUS FailThrough	Select this option to allow the secondary RADIUS server to authenticate wireless clients if the authentication with the primary RADIUS server is unsuccessful, or if the primary RADIUS server is unavailable.
Radio	Select the radio to configure. VAPs are configured independently on each radio.
VAP	You can configure up to 16 VAPs for each radio. VAP0 is the physical radio interface, so to disable VAP0, you must disable the radio.
Enabled	 You can enable or disable a configured network. •) To enable the specified network, select the Enabled option beside the appropriate VAP. •) To disable the specified network, clear the Enabled option beside the appropriate VAP. If you disable the specified network, you will lose the VLAN ID you entered.
VLAN ID	 When a wireless client connects to the AP by using this VAP, the AP tags all traffic from the wireless client with the VLAN ID you enter in this field unless you enter the untagged VLAN ID or use a RADIUS server to assign a wireless client to a VLAN. The range for the VLAN ID is 1 – 4094. If you use RADIUS-based authentication for clients, you can optionally add the following attributes to the appropriate file in the RADIUS or AAA server to configure a VLAN for the client: "Tunnel-Type" "Tunnel-Medium-Type" "Tunnel-Private-Group-ID" The RADIUS-assigned VLAN ID overrides the VLAN ID you configure on the VAP page. You configure the untagged and management VLAN IDs on the Ethernet Settings page. For more information, see "Ethernet Settings" on page 36.
SSID	Enter a name for the wireless network. The SSID is an alphanumeric string of up to 32 characters. You can use the same SSID for multiple VAPs, or you can choose a unique SSID for each VAP. Note: If you are connected as a wireless client to the same AP that you are administering, resetting the SSID will cause you to lose connectivity to the AP. You will need to reconnect to the new SSID after you save this new setting.

Field	Description
Broadcast SSID	 Specify whether to allow the AP to broadcast the Service Set Identifier (SSID) in its beacon frames. The Broadcast SSID parameter is enabled by default. When the VAP does not broadcast its SSID, the network name is not displayed in the list of available networks on a client station. Instead, the client must have the exact network name configured in the supplicant before it is able to connect. •) To enable the SSID broadcast, select the Broadcast SSID check box. •) To prohibit the SSID broadcast, clear the Broadcast SSID check box. •) To prohibit the SSID broadcast, clear the Broadcast SSID check box. Note: Disabling the broadcast SSID is sufficient to prevent clients from accidentally connecting to your network, but it will not prevent even the simplest of attempts by a hacker to connect or monitor unencrypted traffic. Suppressing the SSID broadcast offers a very minimal level of protection on an otherwise exposed network (such as a guest network) where the priority is making it easy for clients to get a connection and where no sensitive information is available.
Security	 Select one of the following Security modes for this VAP: •) None •) Static WEP •) WPA Personal •) IEEE 802.1X •) WPA Enterprise If you select a security mode other than None, additional fields appear. These fields are explained below. Note: The Security mode you set here is specifically for this VAP.
MAC Authentication Type	 You can configure a global list of MAC addresses that are allowed or denied access to the network. The drop-down menu for this feature allows you to select the type of MAC Authentication to use: Disabled: Do not use MAC Authentication. Local: Use the MAC Authentication list that you configure on the MAC Authentication page. RADIUS: Use the MAC Authentication list on the external RADIUS server. For more information about MAC Authentication, see "Controlling Access by MAC Authentication" on page 63.
MFP (Management Frame Protection)	Provides security for the otherwise unprotected and unencrypted 802.11 management frames. This field is visible only when wpa2 security and CCMP fields are enabled. Following 3 check box values can be configured for it. • Not Required • Capable • Required By default Not Required is selected. On selecting Required , Capable checkbox will be selected and disabled.

Table 24 - Virtual Access Point Settings

None (Plain-text)

If you select **None** as your security mode, no further options are configurable on the AP. This mode means that any data transferred to and from the UAP is not encrypted. This security mode can be useful during initial network configuration or for problem solving, but it is not recommended for regular use on the Internal network because it is not secure.

Static WEP

Wired Equivalent Privacy (WEP) is a data encryption protocol for 802.11 wireless networks. All wireless stations and APs on the network are configured with a static 64-bit (40-bit secret key + 24-bit initialization vector (IV)) or 128-bit (104-bit secret key + 24-bit IV) Shared Key for data encryption.

Static WEP is not the most secure mode available, but it offers more protection than setting the security mode to None (Plain-text) as it does prevent an outsider from easily sniffing out unencrypted wireless traffic.

WEP encrypts data moving across the wireless network based on a static key. (The encryption algorithm is a stream cipher called RC4.)

VAP Enabled	VLAN ID	SSID	Broadcast SSID	Security	MAC Auth Type	Redirect Mode	Redirect Url
0	1	dlink1		Static WEP	Disabled 💌	None 💌	
				Transfer key index: 1 •			1
				Key Length: 1 64 bits	128 bits		
				Key Type: 💿 ASCII	Hex		
				WEP Keys:	(Characters requ	ired: 26)	
				2.			
				3:			
				4:			
				Authentication : V Open	system 🗏 Shared	key	

Figure 25 - Modify Virtual Access Point Settings (Static WEP)

Field	Description
Transfer Key Index	Select a key index from the drop-down menu. Key indexes 1 through 4 are available. The default is 1. The Transfer Key Index indicates which WEP key the AP will use to encrypt the data it transmits.
Key Length	 Specify the length of the key by clicking one of the radio buttons: •) 64 bits •) 128 bits
Кеу Туре	Select the key type by clicking one of the radio buttons:•) ASCII•) Hex
WEP Keys	 You can specify up to four WEP keys. In each text box, enter a string of characters for each key. The keys you enter depend on the key type selected: ASCII — Includes upper and lower case alphabetic letters, the numeric digits, and special symbols such as @ and #. Hex — Includes digits 0 to 9 and the letters A to F. Use the same number of characters for each key as specified in the Characters Required field. These are the RC4 WEP keys shared with the stations using the AP. Each client station must be configured to use one of these same WEP keys in the same slot as specified here on the AP. Characters Required: The number of characters you enter into the WEP Key fields is determined by the Key length and Key type you select. For example, if you use 128-bit ASCII keys, you must enter 26 characters in the WEP key. The number of characters required updates automatically based on how you set Key Length and Key Type.

Field	Description
Authentication	 The authentication algorithm defines the method used to determine whether a client station is allowed to associate with an AP when static WEP is the security mode. Specify the authentication algorithm you want to use by choosing one of the following options: Open System authentication allows any client station to associate with the AP whether that client station has the correct WEP key or not. This algorithm is also used in plaintext, IEEE 802.1X, and WPA modes. When the authentication algorithm is set to Open System, any client can associate with the AP. Note: Just because a client station is allowed to associate does not ensure it can exchange traffic with an AP. A station must have the correct WEP key to be able to successfully access and decrypt data from an AP, and to transmit readable data to the AP. Shared Key authentication requires the client station algorithm is set to Shared Key, a station with an incorrect WEP key will not be able to associate with the AP. Both Open System and Shared Key. When you select both authentication algorithms: Client stations configured to use WEP in shared key mode must have a valid WEP key in order to associate with the AP. Client stations configured to use WEP as an open system (shared key mode not enabled) will be able to associate with the AP.
	Table 25 - Static WEP

Static WEP Rules

If you use Static WEP, the following rules apply:

- •) All client stations must have the Wireless LAN (WLAN) security set to WEP, and all clients must have one of the WEP keys specified on the AP in order to de-code AP-to-station data transmissions.
- •) The AP must have all keys used by clients for station-to-AP transmit so that it can de-code the station transmissions.
- •) The same key must occupy the same slot on all nodes (AP and clients). For example if the AP defines abc123 key as WEP key 3, then the client stations must define that same string as WEP key 3.
- •) Client stations can use different keys to transmit data to the access point. (Or they can all use the same key, but this is less secure because it means one station can decrypt the data being sent by another.)
- •) On some wireless client software, you can configure multiple WEP keys and define a client station "transfer key index", and then set the stations to encrypt the data they transmit using different keys. This ensures that neighboring APs cannot decode each other's transmissions.
- •) You cannot mix 64-bit and 128-bit WEP keys between the access point and its client stations.

IEEE 802.1X

IEEE 802.1X is the standard defining port-based authentication and infrastructure for doing key management. Extensible Authentication Protocol (EAP) messages sent over an IEEE 802.11 wireless network using a protocol called EAP Encapsulation Over LANs (EAPOL). IEEE 802.1X provides dynamically-generated keys that are periodically refreshed. An RC4 stream cipher is used to encrypt the frame body and cyclic redundancy checking (CRC) of each 802.11 frame.

This mode requires the use of an external RADIUS server to authenticate users. The AP requires a RADIUS server capable of EAP, such as the Microsoft Internet Authentication Server. To work with Windows clients, the authentication server must support Protected EAP (PEAP) and MSCHAP V2.

You can use any of a variety of authentication methods that the IEEE 802.1X mode supports, including certificates, Kerberos, and public key authentication. You must configure the client stations to use the same authentication method the AP uses.

Figure 26 - Modify Virtual Access Point Settings (IEEE802.1X)

Field	Description
Use Global RADIUS Server Settings	By default each VAP uses the global RADIUS settings that you define for the AP at the top of the VAP page. However, you can configure each VAP to use a different set of RADIUS servers. To use the global RADIUS server settings, make sure the check box is selected. To use a separate RADIUS server for the VAP, clear the check box and enter the RADIUS server IP address and key in the following fields.
RADIUS IP Address Type	Specify the IP version that the RADIUS server uses. You can toggle between the address types to configure IPv4 and IPv6 global RADIUS address settings, but the AP contacts only the RADIUS server or servers for the address type you select in this field.
RADIUS IP Address RADIUS IPv6 Address	Enter the IPv4 or IPv6 address for the primary RADIUS server for this VAP. If the IPv4 RADIUS IP Address Type option is selected in the previous field, enter the IP address of the RADIUS server that all VAPs use by default, for example 192.168.10.23. If the IPv6 RADIUS IP Address Type option is selected, enter the IPv6 address of the primary global RADIUS server, for example 2001:0db8:1234::abcd.
RADIUS IP or IPv6 Address 1–3	Enter up to three IPv4 and/or IPv6 addresses to use as the backup RADIUS servers for this VAP. The field label is RADIUS IP Address when the IPv4 RADIUS IP Address Type option is selected and RADIUS IPv6 Address when the IPv6 RADIUS IP Address Type option is selected. If authentication fails with the primary server, each configured backup server is tried in sequence.
RADIUS Key	Enter the RADIUS key in the text box. The <i>RADIUS Key</i> is the shared secret key for the global RADIUS server. You can use up to 63 standard alphanumeric and special characters. The key is case sensitive, and you must configure the same key on the AP and on your RADIUS server. The text you enter will be displayed as "*" characters to prevent others from seeing the RADIUS key as you type.
RADIUS Key 1 – 3	Enter the RADIUS key associated with the configured backup RADIUS servers. The server at RADIUS IP Address-1 uses RADIUS Key-1, RADIUS IP Address-2 uses RADIUS Key-2, and so on.
Enable RADIUS Accounting	Select this option to track and measure the resources a particular user has consumed such as system time, amount of data transmitted and received, and so on. If you enable RADIUS accounting, it is enabled for the primary RADIUS server and all backup servers.
Enable RADIUS FailThrough	Select this option to allow the secondary RADIUS server to authenticate wireless clients if the authentication with the primary RADIUS server is unsuccessful, or if the primary RADIUS server is unavailable.
Active Server	Specify which configured RADIUS server to use as the active RADIUS server.
Broadcast Key Refresh Rate	Enter a value to set the interval at which the broadcast (group) key is refreshed for clients associated to this VAP (the default is 300). The valid range is 0 – 86400 seconds. A value of 0 indicates that the broadcast key is not refreshed.

Field	Description
Session Key	Enter a value to set the interval at which the AP will refresh session (unicast) keys for each client associated to the VAP.
Refresh Rate	The valid range is 0 – 86400 seconds. A value of 0 indicates that the broadcast key is not refreshed.

Table 26 - IEEE 802.1X

Note: After you configure the security settings, you must click **Apply** to apply the changes and to save the settings.

WPA Personal

WPA Personal is a Wi-Fi Alliance IEEE 802.11i standard, which includes AES-CCMP and TKIP mechanisms. The Personal version of WPA employs a pre-shared key (instead of using IEEE 802.1X and EAP as is used in the Enterprise WPA security mode). The PSK is used for an initial check of credentials only.

This security mode is backwards-compatible for wireless clients that support the original WPA.

Figure 27 - Modify Virtual Access Point Settings (WPA Personal)

Field	Description
WPA Versions	 Select the types of client stations you want to support: WPA. If all client stations on the network support the original WPA but none support the newer WPA2, then select WPA. WPA2. If all client stations on the network support WPA2, we suggest using WPA2 which provides the best security per the IEEE 802.11i standard. WPA and WPA2. If you have a mix of clients, some of which support WPA2 and others which support only the original WPA, select both of the check boxes. This lets both WPA and WPA2 client stations associate and authenticate, but uses the more robust WPA2 for clients who support it. This WPA configuration allows more inter-operability, at the expense of some security.
Cipher Suites	 Select the cipher suite you want to use: •) TKIP •) CCMP (AES) •) TKIP and CCMP (AES) Both TKIP and AES clients can associate with the AP. WPA clients must have one of the following to be able to associate with the AP: •) A valid TKIP key •) A valid AES-CCMP key Clients not configured to use a WPA Personal will not be able to associate with the AP.
Кеу	The Pre-shared Key is the shared secret key for WPA Personal. Enter a string of at least 8 characters to a maximum of 63 characters. Acceptable characters include upper and lower case alphabetic letters, the numeric digits, and special symbols such as @ and #.
Broadcast Key Refresh Rate	Enter a value to set the interval at which the broadcast (group) key is refreshed for clients associated to this VAP (the default is 300). The valid range is 0–86400 seconds. A value of 0 indicates that the broadcast key is not refreshed.

Table 27 - WPA Personal

Note: After you configure the security settings, you must click **Apply** to apply the changes and to save the settings.

WPA Enterprise

WPA Enterprise with RADIUS is an implementation of the Wi-Fi Alliance IEEE 802.11i standard, which includes CCMP (AES), and TKIP mechanisms. The Enterprise mode requires the use of a RADIUS server to authenticate users.

This security mode is backwards-compatible with wireless clients that support the original WPA.

VAP Enabled	VLAN ID	SSID	Broadcast SSID	Security	MAC Auth Type	Redirect Mode	Redirect	Url	: Url	: Url	: Url	: Url

Figure 28 - Modify Virtual Access Point Settings (WPA Enterprise)

Field	Description
WPA Versions	 Select the types of client stations you want to support: WPA. If all client stations on the network support the original WPA but none support the newer WPA2, then select WPA. WPA2. If all client stations on the network support WPA2, we suggest using WPA2 which provides the best security per the IEEE 802.11i standard. WPA and WPA2. If you have a mix of clients, some of which support WPA2 and others which support only the original WPA, select both WPA and WPA2. This lets both WPA and WPA2 client stations associate and authenticate, but uses the more robust WPA2 for clients who support it. This WPA configuration allows more interoperability, at the expense of some security.
Enable pre- authentication	If for WPA Versions you select only WPA2 or both WPA and WPA2, you can enable pre- authentication for WPA2 clients. Click Enable pre-authentication if you want WPA2 wireless clients to send pre- authentication packet. The pre-authentication information will be relayed from the AP the client is currently using to the target AP. Enabling this feature can help speed up authentication for roaming clients who connect to multiple APs. This option does not apply if you selected WPA for WPA Versions because the original WPA does not support this feature.
Cipher Suites	 Select the cipher suite you want to use:) TKIP) CCMP (AES)) TKIP and CCMP (AES) By default both TKIP and CCMP are selected. When both TKIP and CCMP are selected, client stations configured to use WPA with RADIUS must have one of the following:) A valid TKIP RADIUS IP address and RADIUS Key) A valid CCMP (AES) IP address and RADIUS Key
Use Global RADIUS Server Settings	By default each VAP uses the global RADIUS settings that you define for the AP at the top of the VAP page. However, you can configure each VAP to use a different set of RADIUS servers. To use the global RADIUS server settings, make sure the check box is selected. To use a separate RADIUS server for the VAP, clear the check box and enter the RADIUS server IP address and key in the following fields.

Field	Description
RADIUS IP Address Type	Specify the IP version that the RADIUS server uses. You can toggle between the address types to configure IPv4 and IPv6 global RADIUS address settings, but the AP contacts only the RADIUS server or servers for the address type you select in this field.
RADIUS IP Address RADIUS IPv6 Address	Enter the IPv4 or IPv6 address for the primary RADIUS server for this VAP. If the IPv4 RADIUS IP Address Type option is selected in the previous field, enter the IP address of the RADIUS server that all VAPs use by default, for example 192.168.10.23. If the IPv6 RADIUS IP Address Type option is selected, enter the IPv6 address of the primary global RADIUS server, for example 2001:0db8:1234::abcd.
RADIUS IP or IPv6 Address 1–3	Enter up to three IPv4 and/or IPv6 addresses to use as the backup RADIUS servers for this VAP. The field label is RADIUS IP Address when the IPv4 RADIUS IP Address Type option is selected and RADIUS IPv6 Address when the IPv6 RADIUS IP Address Type option is selected. If authentication fails with the primary server, each configured backup server is tried in sequence.
RADIUS Key	Enter the RADIUS key in the text box. The <i>RADIUS Key</i> is the shared secret key for the global RADIUS server. You can use up to 63 standard alphanumeric and special characters. The key is case sensitive, and you must configure the same key on the AP and on your RADIUS server. The text you enter will be displayed as "*" characters to prevent others from seeing the RADIUS key as you type.
RADIUS Key 1–3	Enter the RADIUS key associated with the configured backup RADIUS servers. The server at RADIUS IP Address-1 uses RADIUS Key-1, RADIUS IP Address-2 uses RADIUS Key-2, and so on.
Enable RADIUS Accounting	Select this option to track and measure the resources a particular user has consumed such as system time, amount of data transmitted and received, and so on. If you enable RADIUS accounting, it is enabled for the primary RADIUS server and all backup servers.
Enable RADIUS FailThrough	Select this option to allow the secondary RADIUS server to authenticate wireless clients if the authentication with the primary RADIUS server is unsuccessful, or if the primary RADIUS server is unavailable.
Active Server	Specify which configured RADIUS server to use as the active RADIUS server.
Broadcast Key Refresh Rate	Enter a value to set the interval at which the broadcast (group) key is refreshed for clients associated to this VAP (the default is 300). The valid range is 0–86400 seconds. A value of 0 indicates that the broadcast key is not refreshed.
Session Key Refresh Rate	Enter a value to set the interval at which the AP will refresh session (unicast) keys for each client associated to the VAP. The valid range is 0–86400 seconds. A value of 0 indicates that the broadcast key is not refreshed.

Table 28 - WPA Enterprise

Note: After you configure the security settings, you must click **Apply** to apply the changes and to save the settings.

Configuring Wireless Multicast Forwarding

The Wireless Multicast Forwarding provides an efficient way to forward the multicast traffic on the wireless medium and overcomes the multicast transmission issues on WLAN using the repeated unicast of multicast frames. It uses IGMP frames to keep track of participating group members, and multicast packets are transmitted only to the interested members after unicast MAC conversion.

With WMF, the data transfer is more reliable as the frames are sent as unicast, and robust transmission is possible as dynamic per station rate control can be done based on the link errors and noise conditions. The multicast group members can be a STA end point. Streaming between STA devices will also be supported. The multicast streaming server can be attached to any of the LAN ports.

Field	Description
VAP	 You can configure up to 16 VAPs for each radio. VAP0 is the physical radio interface, so to disable VAP0, you must disable the radio.
Enabled	You can enable or disable a configured network. If you disable the specified network, you will lose the VLAN ID you enabled
WMF-Enable	Enable/Disable the WMF status in a VAP.

Table 29 - Wireless Multicast Forwarding

Configuring the Wireless Distribution System (WDS)

The Wireless Distribution System (WDS) allows you to connect multiple UAPs. With WDS, APs communicate with one another without wires in a standardized way. This capability is critical in providing a seamless experience for roaming clients and for managing multiple wireless networks. It can also simplify the network infrastructure by reducing the amount of cabling required. You can configure the AP in point-to-point or point-to-multipoint bridge mode based on the number of links to connect.

In the point-to-point mode, the AP accepts client associations and communicates with wireless clients and other repeaters. The AP forwards all traffic meant for the other network over the tunnel that is established between the APs. The bridge does not add to the hop count. It functions as a simple OSI layer 2 network device.

In the point-to-multipoint bridge mode, one AP acts as the common link between multiple APs. In this mode, the central AP accepts client associations and communicates with the clients and other repeaters. All other APs associate only with the central AP that forwards the packets to the appropriate wireless bridge for routing purposes.

The UAP can also act as a repeater. In this mode, the AP serves as a connection between two APs that might be too far apart to be within cell range. When acting as a repeater, the AP does not have a wired connection to the LAN and repeats signals by using the wireless connection. No special configuration is required for the AP to function as a repeater, and there are no repeater mode settings. Wireless clients can still connect to an AP that is operating as a repeater.

Note: When you move an AP from Standalone Mode to Managed Mode, WDS is disabled. In Managed Mode, you configure the AP by using the D-Link Unified Wireless Switch. The Administrator UI, as well as Telnet, SSH, and SNMP access are disabled when the AP is in Managed Mode.

To specify the details of traffic exchange from this access point to others, click the **WDS** tab.

Configure WDS brid	iges to other access p

Figure 30 - Configure WDS Bridges

Before you configure WDS on the AP, note the following guidelines:

- •) When using WDS, be sure to configure WDS settings on both APs participating in the WDS link.
- •) You can have only one WDS link between any pair of APs. That is, a remote MAC address may appear only once on the WDS page for a particular AP.
- •) Both APs participating in a WDS link must be on the same Radio channel and using the same IEEE 802.11 mode. (See "Modifying Radio Settings" on page 42 for information on configuring the Radio mode and channel.)
- •) When 802.11h is operational, setting up two WDS links can be difficult.

To configure WDS on this AP, describe each AP intended to receive handoffs and send information to this AP. For each destination AP, configure the fields listed in the table below.

Field	Description
Spanning Tree Mode	Spanning Tree Protocol (STP) prevents switching loops. STP is recommended if you configure WDS links. Select Enabled to use STP Select Disabled to turn off STP links (not recommended)
Radio	For each WDS link on a two-radio AP, select Radio One or Radio Two. The rest of the settings for the link apply to the radio selected in this field. The read-only Local Address will change depending on which Radio you select in this field.
Local Address	Indicates the MAC addresses for this AP. For each WDS link on a two-radio AP, the Local Address reflects the MAC address for the internal interface on the selected radio (Radio One on wlan0 or Radio Two on wlan1).
Remote Address	Specify the MAC address of the destination AP; that is, the AP on the other end of the WDS link to which data will be sent or handed-off and from which data will be received. Click the drop-down arrow to the right of the Remote Address field to see a list of all the available MAC Addresses and their associated SSIDs on the network. Select the appropriate MAC address from the list. Note: The SSID displayed in the drop-down list is simply to help you identify the correct MAC Address for the destination AP. This SSID is a separate SSID to that which you set for the WDS link. The two do not (and should not) be the same value or name.
Encryption	You can use no encryption , WEP , or WPA (PSK) on the WDS link. If you are unconcerned about security issues on the WDS link you may decide not to set any type of encryption. Alternatively, if you have security concerns you can choose between Static WEP and WPA (PSK). In WPA (PSK) mode, the AP uses WPA2-PSK with CCMP (AES) encryption over the WDS link.

Table 30 - WDS Settings

If you select **None** as your preferred WDS encryption option, you will not be asked to fill in any more fields on the **WDS** page. All data transferred between the two APs on the WDS link will be unencrypted.

Note: To disable a WDS link, you must remove the value configured in the Remote Address field.

WEP on WDS Links

The following table describes the additional fields that appear when you select WEP as the encryption type.

Field	Description
Encryption	WEP
WEP	Select this option if you want to set WEP encryption on the WDS link.
Key Length	If WEP is enabled, specify the length of the WEP key: •) 64 bits •) 128 bits
Кеу Туре	If WEP is enabled, specify the WEP key type: •) ASCII •) Hex
Characters Required	Indicates the number of characters required in the WEP key. The number of characters required updates automatically based on how you set Key Length and Key Type.
WEP Key	Enter a string of characters. If you selected ASCII, enter any combination of $0 - 9$, $a - z$, and $A - Z$. If you selected HEX, enter hexadecimal digits (any combination of $0 - 9$ and $a - f$ or $A - F$). These are the RC4 encryption keys shared with the stations using the AP.

Table 31 - WEP on WDS Links

WPA/PSK on WDS Links

The following table describes the additional fields that appear when you select WPA/PSK as the encryption type.

Note: In order to configure WPA-PSK on any WDS link, VAP0 of the selected radio must be

CO	ntigured for WPA-PSK or WPA-Enterprise.
· ·	
Field	Description
Encryption	WPA (PSK)
SSID	Enter an appropriate name for the new WDS link you have created. This SSID should be different from the other SSIDs used by this AP. However, it is important that the same SSID is also entered at the other end of the WDS link. If this SSID is not the same for both APs on the WDS link, they will not be able to communicate and exchange data. The SSID can be any alphanumeric combination.
Кеу	Enter a unique shared key for the WDS bridge. This unique shared key must also be entered for the AP at the other end of the WDS link. If this key is not the same for both APs, they will not be able to communicate and exchange data. The WPA-PSK key is a string of at least 8 characters to a maximum of 63 characters. Acceptable characters include upper and lower case alphabetic letters, the numeric digits, and special symbols such as @ and #.

Table 32 - WPA/PSK on WDS Links

Note: After you configure the WDS settings, you must click **Apply** to apply the changes and to save the settings. Changing some settings might cause the AP to stop and restart system processes. If this happens, wireless clients will temporarily lose connectivity. We recommend that you change AP settings when WLAN traffic is low.

Controlling Access by MAC Authentication

A Media Access Control (MAC) address is a hardware address that uniquely identifies each node of a network. All IEEE 802 network devices share a common 48-bit MAC address format, usually displayed as a string of 12 hexadecimal digits separated by colons, for example 00:DC:BA:09:87:65. Each wireless network interface card (NIC) used by a wireless client has a unique MAC address.

You can use the Administrator UI on the AP or use an external RADIUS server to control access to the network through the AP based on the MAC address of the wireless client. This feature is called MAC Authentication or MAC Filtering. To control access, you configure a global list of MAC addresses locally on the AP or on an external RADIUS server. Then, you set a filter to specify whether the clients with those MAC addresses are allowed or denied access to the network. When a wireless client attempts to associate with an AP, the AP looks up the MAC address of the client in the local Stations List or on the RADIUS server. If it is found, the global allow or deny setting is applied. If it is not found, the opposite is applied.

On the **VAP** page, the MAC Authentication Type setting controls whether the AP uses the station list configured locally on the **MAC Authentication** page or the external RADIUS server. The Allow/Block filter setting on the **MAC Authentication** page determines whether the clients in the station list (local or RADIUS) can access the network through the AP. For more information about setting the MAC authentication type, see "Virtual Access Point Settings" on page 50.

Configuring a MAC Filter and Station List on the AP

The **MAC Authentication** page allows you to control access to UAP based on MAC addresses. Based on how you set the filter, you can *allow* only client stations with a listed MAC address or *deny* access to the stations listed.

When you enable MAC Authentication and specify a list of approved MAC addresses, only clients with a listed MAC address can access the network. If you specify MAC addresses to deny, all clients can access the network except for the clients on the deny list.

Configure MAC Authentication of client stations	
Filter	 Allow only stations in list Block all stations in list
Stations List	
Click "Apply" to save the new settings.	

Figure 31 - Configure MAC Authentication

Note: Global MAC Authentication settings apply to all VAPs on all supported radios.

The following table describes the fields and configuration options available on the MAC Authentication page.

Field	Description
Filter	 To set the MAC Address Filter, select one of the following options: Allow only stations in the list. Any station that is not in the Stations List is denied access to the network through the AP. Block all stations in list. Only the stations that appear in the list are denied access to the network through the AP. All other stations are permitted access. Note: The filter you select is applied to the clients in the station list, regardless of whether that station list is local or on the RADIUS server.
Stations List	This is the local list of clients that are either permitted or denied access to the network through the AP. To add a MAC Address to the local Stations List, enter its 48-bit MAC address into the lower text boxes, then click Add . To remove a MAC Address from the Stations List, select its 48-bit MAC address, then click Remove . The stations in the list will either be allowed or denied access based on how you set the filter in the previous field. Note: If the MAC authentication type for the VAP is set to Local, the AP uses the Stations List to permit or deny the clients access to the network. If the MAC authentication type is set to RADIUS, the AP ignores the MAC authentication type is set on the VAP configuration page.

Note: After you configure local MAC Authentication settings, you must click **Apply** to apply the changes and to save the settings. Changing some settings might cause the AP to stop and restart system processes. If this happens, wireless clients will temporarily lose connectivity. We recommend that you change AP settings when WLAN traffic is low.

Configuring MAC Authentication on the RADIUS Server

If you use RADIUS MAC authentication for MAC-based access control, you must configure a station list on the RADIUS server. The station list contains client MAC address entries, and the format for the list is described in the following table.

RADIUS Server Attribute	Description	Value
User-Name (1)	MAC address of the client station.	Valid Ethernet MAC Address.
User-Password (2)	A fixed global password used to lookup a client MAC entry.	NOPASSWORD

Table 34 - RADIUS Server Attributes for MAC Authentication

Configuring Load Balancing

You can set network utilization thresholds on the UAP to maintain the speed and performance of the wireless network as clients associate and disassociate with the AP. The load balancing settings apply to all supported radios.

To configure load balancing and set limits and behaviour to be triggered by a specified utilization rate of the access point, click the **Load Balancing** tab and update the fields shown in the following figure.

Modify load balancing settings		
Load Balancing	C Enabled Disabled	
Utilization for No New Assocations	0 (Percent, 0 disables)	
Click "Apply" to save the new settings.		

Figure 32 - Modify Load Balancing Settings

Field	Description
Load Balancing	Enable or disable load balancing: To enable load balancing on this AP, click Enable . To disable load balancing on this AP, click Disable .
Utilization for No New Associations	Provide the percentage of network bandwidth utilization allowed on the radio before the AP stops accepting new client associations. The default is 0, which means that all new associations will be allowed regardless of the utilization rate.

Table 35 - Load Balancing

Managed Access Point Overview

The UAP can operate in two modes: **Standalone Mode** or **Managed Mode**. In Standalone Mode, the UAP acts as an individual AP in the network, and you manage it by using the Administrator Web User Interface (UI), CLI, or SNMP. In Managed Mode, the UAP is part of the D-Link Unified Wired and Wireless System, and you manage it by using the D-Link Unified Wireless System. In Managed Mode, the UAP is in Managed Mode, the Administrator Web UI, Telnet, SSH, and SNMP services are disabled.

On the UAP, you can configure the IP addresses of up to four D-Link Unified Wireless Switches that can manage it. In order to manage the AP, the switch and AP must discover each other. There are multiple ways for a switch to discover an AP. Adding the IP address of the switch to the AP while it is in Standalone Mode is one way to enable switch-to-AP discovery.

Transition Between Modes

Every 30 seconds, the D-Link Unified Wireless Switch sends a keepalive message to all of the access points it manages. Each AP checks for the keepalive messages on the SSL TCP connection. As long as the AP maintains communication with the switch through the keepalive messages, it remains in Managed Mode.

If the AP does not receive a message within 45 seconds of the last keepalive message, the AP assumes the switch has failed and terminates its TCP connection to the switch, and the AP enters Standalone Mode.

Once the AP transitions to Standalone Mode, it continues to forward traffic without any loss. The AP uses the configuration on the VAPs configured in VLAN Forwarding mode (the standard, non-tunneled mode).

While the AP is in Standalone Mode, you can manage it by using the Web interface or the CLI (through Telnet or SSH).

For any clients that are connected to the AP through tunneled VAPs, the AP sends disassociate messages and disables the tunneled VAPs.

As long as the Managed AP Administrative Mode is set to Enabled, the AP starts discovery procedures. If the AP establishes a connection with a wireless switch, which may or may not be the same switch it was connected to before, the switch sends the AP its configuration and the AP sends the wireless switch information about all currently associated clients.

After the configuration from the switch is applied, the AP radio(s) restart. Client traffic is briefly interrupted until the radio(s) are up and the clients are re-associated.

Configuring Managed Access Point Settings

To add the IP address of a D-Link Unified Wireless Switch to the AP, click the **Managed Access Point** tab under the **Manage** heading and update the fields shown in the table below.

Configure Managed AP	Wireless Switch Param	ete
Managed AP Adminstrative Mode	Enabled Disabled	
Switch IP Address 1		
Switch IP Address 2		
Switch IP Address 3	-	
Switch IP Address 4		
Pass Phrase		
Click "Apply" to save the new setting	s.	

Figure 33 - Configure Managed AP Wireless Switch Parameters

Field	Description
Managed AP Administrative Mode	Click Enabled to allow the AP and switch to discover each other. If the AP successfully authenticates itself with a wireless switch, you will not be able to access the Administrator UI. Click Disabled to prevent the AP from contacting wireless switches.
Switch IP Address (1-4)	Enter the IP address of up to four wireless switches that can manage the AP. You can enter the IP address in dotted format or as an DNS name. You can view a list of wireless switches on your network that were configured by using a DHCP server. The AP attempts to contact Switch IP Address 1 first.
Base IP Port	The starting IP port number used by the wireless feature (in a range of 10 consecutive port numbers). Only the first number in the range is configurable. The default value is 57775 (through 57784). Note: When the wireless Base IP Port number is changed on the switch, the wireless feature is automatically disabled and re-enabled. The new value is not sent as part of the global switch configuration in the cluster configuration distribution command; every switch in the cluster must be configured independently with the new Wireless IP port number. Note: When the wireless Base IP Port number is changed from its default value on the switch, it must also be changed on the Access Points.
Pass Phrase	Select the Edit option and enter a passphrase to allow the AP to authenticate itself with the wireless switch. The passphrase must be between 8 and 63 characters. To remove the password, select Edit , delete the existing password, and then click Apply . You must configure the same passphrase on the switch.
WDS Managed Mode	 Specify whether the AP will act as a Root AP or Satellite AP within the WDS group: •) Root AP — Acts as a bridge or repeater on the wireless medium and communicates with the switch via the wired link. •) Satellite AP — Communicates with the switch via a WDS link to the Root AP. This mode enables the Satellite AP to discover and establish WDS link with the Root AP.
WDS Managed Ethernet Port	Specify whether the Ethernet port is to be enabled or disabled when the AP becomes part of a WDS group.
WDS Group Password	Password for WPA2 Personal authentication used to establish the WDS links. Only the Satellite APs need this configuration. The Root APs get the password from the switch when they become managed.

Table 36 - Managed Access Point

Note: After you configure the settings on the Managed Access Point page, you must click Apply to apply the changes and to save the settings. Changing some settings might cause the AP to stop and restart system processes. If this happens, wireless clients will temporarily lose connectivity. We recommend that you change AP settings when WLAN traffic is low.

If the UAP successfully authenticates with a D-Link Unified Wireless Switch, you will loose access to the AP through the Administrator UI.

Configuring 802.1X Authentication

On networks that use IEEE 802.1X, port-based network access control, a supplicant (client) cannot gain access to the network until the 802.1X authenticator grants access. If your network uses 802.1X, you must configure 802.1X authentication information that the AP can supply to the authenticator.

To configure the UAP 802.1X supplicant user name and password by using the Web interface, click the **Authentication** tab and configure the fields shown in the table below.

Modify 802.1X Supplicant Authentication settings
Click "Refresh" button to refresh the page. Refresh
Supplicant Configuration
802.1X Supplicant Enabled Disabled

Fiename Draws
Upload

Figure 34 - Modify 802.1X Supplicant Authentication Settings

Field	Description
802.1X Supplicant	Click Enabled to enable the Administrative status of the 802.1X Supplicant. Click Disabled to disable the Administrative status of the 802.1X Supplicant.
EAP Method	 Select one of the following EAP methods to use for communication between the AP and the authenticator: •) MD5 •) PEAP •) TLS
Username	Enter the user name for the AP to use when responding to requests from an 802.1X authenticator. The user name can be 1 to 64 characters in length. ASCII printable characters are allowed, which includes upper and lower case alphabetic letters, the numeric digits, and special symbols such as @ and #.
Password	Enter the password for the AP to use when responding to requests from an 802.1X authenticator. The password can be 1 to 64 characters in length. ASCII printable characters are allowed, which includes upper and lower case letters, numbers, and special symbols such as @ and #.
Certificate File Status	Indicates whether a certificate file is present and when that certificate expires. It also indicates when the HTTP SSL Certificate file will expire. The range is a valid date. If no certificate file exists on the AP, the field displays Not Present .
Certificate File Upload	 Upload a certificate file to the AP by using HTTP or TFTP: •) HTTP — Browse to the location where the certificate file is stored and click Upload. •) TFTP — Specify the IP address of the TFTP server where the certificate file is located and provide the file name, including the file path, then click Upload.

Table 37 - IEEE 802.1X Supplicant Authentication

Note: After you configure the settings on the Authentication page, you must click **Apply** to apply the changes and to save the settings. Changing some settings might cause the AP to stop and restart system processes. If this happens, wireless clients will temporarily lose connectivity. We recommend that you change AP settings when WLAN traffic is low.

Creating a Management Access Control List (ACL)

You can create an access control list (ACL) that lists up to five IPv4 hosts and five IPv6 hosts that are authorized to access the AP management interface. If this feature is disabled, anyone can access the management interface from any network client by supplying the correct AP username and password.

To create an access list, click the Management ACL tab.

Configure Management	Access Control Parameters
Management ACL Mode	C Enabled Disabled
IP Address 1	
IP Address 2	
IP Address 3	
IP Address 4	
IP Address 5	
IPv6 Address 1	
IPv6 Address 2	
IPv6 Address 3	
IPv6 Address 4	
IPv6 Address 5	
Click "Apply" to save the new settings.	

Field	Description
Management ACL Mode	Enable or disable the management ACL feature. At least one IPv4 address should be configured before enabling Management ACL Mode. If enabled, only the IP addresses you specify will have Web, Telnet, SSH, and SNMP access to the management interface.
IP Address (1–5)	Enter up to five IPv4 addresses that are allowed management access to the AP. Use dotted-decimal format (for example, 192.168.10.10).
IPv6 Address (1–5)	Enter up to five IPv6 addresses that are allowed management access to the AP. Use the standard IPv6 address format (for example 2001:0db8:1234::abcd).

Table 38 - Management ACL

<u>M</u>	Note: After you configure the settings, click Apply to apply the changes and to save the settings.

Section 5 - Configuring Access Point Services

This section describes how to configure services on the UAP and contains the following subsections:

- •) "Web Server Settings" on page 69
- •) "Configuring SNMP on the Access Point" on page 70
- •) "Setting the SSH Status" on page 72
- •) "Setting the Telnet Status" on page 73
- •) "Configuring DDP" on page 73
- •) "Configuring Quality of Service" on page 73
- •) "Configuring Email Alert" on page 76
- •) "Enabling the Time Settings (NTP)" on page 78

Web Server Settings

The AP can be managed through HTTP or secure HTTP (HTTPS) sessions. By default both HTTP and HTTPS access are enabled. Either access type can be disabled separately.

To configure Web server settings, click Web Server tab.

Configure Web Server	Settings
HTTPS Server Status	🖲 Enabled 🔿 Disabled
HTTP Server Status	Enabled O Disabled
HTTP Port	80
Maximum Sessions	5
Session Timeout (minutes)	1440
Click "Apply" to save the new settin	gz.
Generate HTTP SSL Certific	cate
Click "Update" to generate a new Hi	TTP SSL Certificate.
Update

Figure 36 - Configure Web Server Settings

Field	Description
HTTPS Server Status	Enable or disable access through a Secure HTTP Server (HTTPS).
HTTP Server Status	Enable or disable access through HTTP. This setting is independent of the HTTPS server status setting.
HTTP Port	Specify the port number for HTTP traffic (default is 80).
HTTPS Port	Specify the port number for HTTPS traffic (default is 443).
Maximum Sessions	When a user logs on to the AP web interface, a session is created. This session is maintained until the user logs off or the session inactivity timer expires. Enter the number web sessions, including both HTTP and HTTPs, that can exist at the same time. The range is 1–10 sessions. If the maximum number of sessions is reached, the next user who attempts to log on to the AP web interface receives an error message about the session limit.

Field	Description
Session Timeout	Enter the maximum amount of time, in minutes, an inactive user remains logged on to the AP web interface. When the configured timeout is reached, the user is automatically logged off the AP. The range is $1-1440$ minutes (1440 minutes = 1 day).
Generate HTTP SSL (Certificate
Generate HTTP SSL Certificate	Select this option to generate a new SSL certificate for the secure Web server. This should be done once the access point has an IP address to ensure that the common name for the certificate matches the IP address of the UAP. Generating a new SSL certificate will restart the secure Web server. The secure connection will not work until the new certificate is accepted on the browser. Click the Update button to generate the new SSL certificate.
HTTP SSL Certificate	File Status
HTTP SSL Certificate File Status	Indicates whether a certificate file is present and specifies its expiration date and issuer common name.
To Get the Current H	TTP SSL Certificate
Download Method	 Save a copy of the current HTTP SSL certificate on a local system or TFTP server. •) HTTP — Click Download and specify where to store the backup copy of the certificate file. •) TFTP — Provide a file name for the certificate file, including the file path, specify the IP address of the TFTP server where the certificate file copy is to be stored, and then click Download.
HTTP SSL Certificate File	This field is available when the selected download method is TFTP. Enter the filename of the certificate. The filename is a 255-byte alphanumeric string. The default is Mini_httpd.pem.
Server IP	The IPv4 or IPv6 address of the TFTP server where the file will be downloaded. The default is 0.0.0.0.
To Upload an HTTP S	SL Certificate from a PC or a TFTP Server
Upload Method and HTTP SSL Certifcate File	 Upload a certificate file to the AP by using HTTP or TFTP: •) HTTP — Browse to the location where the certificate file is stored and click Upload. •) TFTP — Specify the IP address of the TFTP server where the certificate file is located and provide the file name, including the file path, then click Upload.
Server IP	The IPv4 or IPv6 address of the TFTP server where the file is located. The default is 0.0.0.0.

Table 39 - Web Server Settings

Note: Click **Apply** to apply the changes and to save the settings. If you disable the protocol you are currently using to access the AP management interface, the current connection will end and you will not be able to access the AP by using that protocol until it is enabled.

Configuring SNMP on the Access Point

Simple Network Management Protocol (SNMP) defines a standard for recording, storing, and sharing information about network devices. SNMP facilitates network management, troubleshooting, and maintenance. The AP supports SNMP versions 1, 2, and 3. Unless specifically noted, all configuration parameters on this page apply to SNMPv1 and SNMPv2c only.

Key components of any SNMP-managed network are managed devices, SNMP agents, and a management system. The agents store data about their devices in Management Information Bases (MIBs) and return this data to the SNMP manager when requested. Managed devices can be network nodes such as APs, routers, switches, bridges, hubs, servers, or printers.

The UAP can function as an SNMP managed device for seamless integration into network management systems such as HP OpenView.

From the **SNMP** page under the Services heading, you can start or stop control of SNMP agents, configure community passwords, access MIBs, and configure SNMP Trap destinations.

From the pages under the SNMPv3 heading, you can manage SNMPv3 users and their security levels and define access control to the SNMP MIBs. For information about how to configure SNMPv3 views, groups, users, and targets, see "Section 6 - Configuring SNMPv3" on page 80.

To configure SNMP, click the **SNMP** tab under the **Services** heading and update the fields described in the table below.

SNMP Configurati	on		
SNMP 🖲 Enebled 🔿 Dise	INMP Enabled Disabled		
Read-only community name	(for permitted SNM	P get operations)	public
Port number the SNNP agen	t will listen to		161
Allow SNMP set requests			Enabled O Disabled
Read-write community name	s (for permitted SNN	IP set operations)	private
Restrict the source of SNMP	requests to only the	designated hosts or subnets	🗇 Enabled 🖲 Disabled
Hostname, address, or subn	et of Network Mana;	jement System	
IPv6 hostname, address, or	subnet of Network P	fanagement System	[
Trap Destinations			
Community name for traps			
Enabled	Host Type IPv4 *	Hostname or 3	IP Address
8	IPv4 *		
	IPv4 *		
Click "Apply" to save the new Apply	v settings.		

Figure 37 - SNMP Configuration

Field	Description
SNMP Enabled/ Disabled	You can specify the SNMP administrative mode on your network. By default SNMP is enabled. To enable SNMP, click Enabled . To disable SNMP, click Disabled . After changing the mode, you must click Apply to save your configuration changes. Note: If SNMP is disabled, all remaining fields on the SNMP page are disabled. This is a global SNMP parameter which applies to SNMPv1, SNMPv2c, and SNMPv3.
Read-only community name (for permitted SNMP get operations)	Enter a read-only community name. The valid range is 1-256 characters. The community name, as defined in SNMPv2c, acts as a simple authentication mechanism to restrict the machines on the network that can request data to the SNMP agent. The name functions as a password, and the request is assumed to be authentic if the sender knows the password. The community name can be in any alphanumeric format.
Port number the SNMP agent will listen to	By default an SNMP agent only listens to requests from port 161 . However, you can configure this so the agent listens to requests on another port. Enter the port number on which you want the SNMP agents to listen to requests. The valid range is 1-65535. Note: This is a global SNMP parameter that applies to SNMPv1, SNMPv2c, and SNMPv3.
Allow SNMP set requests	You can choose whether or not to allow SNMP set requests on the AP. Enabling SNMP set requests means that machines on the network can execute configuration changes via the SNMP agent on the AP to the D-Link System MIB. To enable SNMP set requests, click Enabled . To disable SNMP set requests, click Disabled .
Read-write community name (for permitted SNMP set operations)	If you have enabled SNMP set requests you can set a read-write community name. The valid range is 1-256 characters. Setting a community name is similar to setting a password. Only requests from the machines that identify themselves with this community name will be accepted. The community name can be in any alphanumeric format.
Restrict the source of SNMP requests to only the designated hosts or subnets	You can restrict the source of permitted SNMP requests. To restrict the source of permitted SNMP requests, click Enabled . To permit any source submitting an SNMP request, click Disabled .

Field	Description
Hostname, address or subnet of Network Management System	Specify the IPv4 DNS hostname or subnet of the machines that can execute get and set requests to the managed devices. The valid range is 1-256 characters. As with community names, this provides a level of security on SNMP settings. The SNMP agent will only accept requests from the hostname or subnet specified here. To specify a subnet, enter one or more subnetwork address ranges in the form address/ mask_length where address is an IP address and mask_length is the number of mask bits. Both formats address/mask and address/mask_length are supported. Individual hosts can be provided for this, i.e. IP Address or Hostname. For example, if you enter a range of 192.168.1.0/24 this specifies a subnetwork with address 192.168.1.0 and a subnet mask of 255.255.255.0. The address range is used to specify the subnet of the designated NMS. Only machines with IP addresses in this range are permitted to execute get and set requests on the managed device. Given the example above, the machines with addresses from 192.168.1.1 through 192.168.1.254 can execute SNMP commands on the device. (The address, and the address identified by .255 in the range is always reserved for the subnet address, and the address identified by .255 in the range is always reserved for the broadcast address). As another example, if you enter a range of 10.10.1.128/25 machines with IP addresses from 10.10.1.129 through 10.10.1.254 can execute SNMP requests on managed devices. In this example, if you enter a range of 10.10.1.255 is the broadcast address. 126 addresses would be designated.
IPv6 Hostname or IPv6 subnet of Network Management System	Specify the IPv6 DNS hostname or subnet of the machines that can execute get and set requests to the managed devices.
Community name for traps	Enter the global community string associated with SNMP traps. The valid range is 1-256 characters. Traps sent from the device will provide this string as a community name. The community name can be in any alphanumeric format. Special characters are not permitted.
Host Type	Specify whether the enabled host is an IPv4 host or an IPv6 host.
Hostname or IP address	Enter the DNS hostname of the computer to which you want to send SNMP traps. The valid range is 1-256 characters. An example of a DNS hostname is: snmptraps.foo.com. Since SNMP traps are sent randomly from the SNMP agent, it makes sense to specify where exactly the traps should be sent. You can add up to a maximum of three DNS hostnames. Ensure you select the Enabled check box beside the appropriate hostname.

Table 40 - SNMP Settings

Note: After you configure the SNMP settings, you must click **Apply** to apply the changes and to save the settings. Changing some settings might cause the AP to stop and restart system processes. If this happens, wireless clients will temporarily lose connectivity. We recommend that you change AP settings when WLAN traffic is low.

Setting the SSH Status

Secure Shell (SSH) is a program that provides access to the DWL-x600AP CLI from a remote host. SSH is more secure than Telnet for remote access because it provides strong authentication and secure communications over insecure channels. From the SSH page, you can enable or disable SSH access to the system.

Set SSH Status		_	_
SSH Status	۲	Enabled 🔘	Disabled
Click "Apply" to save the new settings.			

Figure 38 - Set SSH Status
Field	Description
SSH Status	Choose to either enable or disable SSH access to the AP CLI:
	 To prevent remote access to the AP by using SSH, click Enabled. To prevent remote access to the AP by using SSH, click Disabled.

Table 41 - SSH Settings

Setting the Telnet Status

Telnet is a program that provides access to the DWL-x600AP CLI from a remote host. From the Telnet page, you can enable or disable Telnet access to the system.

Set Telnet Status				
Telnet Status	Enabled Disabled Disabled			
Click "Apply" to save the new settings. Apply				

Figure 39 - Set Telnet Status

Field	Description
Telnet Status	 Choose to either enable or disable Telnet access to the AP CLI: •) To permit remote access to the AP by using Telnet, click Enabled. •) To prevent remote access to the AP by using Telnet, click Disabled.

Table 42 - Telnet Settings

Configuring DDP

DDP (D-Link Discover Protocol) supports basic command (IP, factory reset, F/W upgrade, etc.) to setting UAP, and user can use DNA (D-Link Network Assistance) to configure basic setting. From the DDP page, you can enable or disable DDP daemon to the system.

Set DDP Status		
DDP Status	Enabled O Disabled	
Click "Update" to save the new s	ings.	

Figure 40 - DDP Status Configuration

Field	Description
DDP Status	 Choose to either enable or disable DDP access to the AP CLI: •) To start DDP daemon, click Enabled. •) To stop DDP daemon, click Disabled.

Table 43 - DDP Settings

Configuring Quality of Service

Quality of Service (QoS) provides you with the ability to specify parameters on multiple queues for increased throughput and better performance of differentiated wireless traffic like Voice-over-IP (VoIP), other types of audio, video, and streaming media, as well as traditional IP data over the UAP.

Configuring QoS on the UAP consists of setting parameters on existing queues for different types of wireless traffic, and effectively specifying minimum and maximum wait times (through Contention Windows) for transmission. The settings described here apply to data transmission behavior on the AP only, not to that of the client stations.

AP Enhanced Distributed Channel Access (EDCA) Parameters affect traffic flowing from the AP to the client station.

Station Enhanced Distributed Channel Access (EDCA) Parameters affect traffic flowing from the client station to the AP.

The default values for the AP and station EDCA parameters are those suggested by the Wi-Fi Alliance in the WMM specification. In normal use these values should not need to be changed. Changing these values will affect the QoS provided.

Note: On the DWL-6600AP, DWL-8600AP, DWL-6610AP, DWL-8610AP, and DWL-8710AP devices, the QoS settings apply to both radios, but the traffic for each radio is queued independently.

To set up queues for QoS, click the **QoS** tab under the **Services** heading and configure settings as described in the table below.

DCA Template	Outton

Figure 41 - Modify QoS Queue Parameters

Field	Description					
Radio	Select the radio with the QoS settings to view or configure.					
EDCA Template	Possible options are: Default, Optimized for Voice, and Custom.					
AP EDCA Parameters	5					
Queue	 Queues are defined for different types of data transmitted from AP-to-station: •) Data 0 (Voice) — High priority queue, minimum delay. Time-sensitive data such as VoIP and streaming media are automatically sent to this queue. •) Data 1(Video) — High priority queue, minimum delay. Time-sensitive video data is automatically sent to this queue. •) Data 2 (Best Effort) — Medium priority queue, medium throughput and delay. Most traditional IP data is sent to this queue. •) Data 3 (Background) — Lowest priority queue, high throughput. Bulk data that requires maximum throughput and is not time-sensitive is sent to this queue (FTP data, for example). 					
AIFS (Inter-Frame Space)	The Arbitration Inter-Frame Spacing (AIFS) specifies a wait time for data frames. The wait time is measured in slots. Valid values for AIFS are 1 through 255.					

Field	Description
cwMin (Minimum	This parameter is input to the algorithm that determines the initial random back off wait time
Contention Window)	(window) for retry of a transmission.
	range from which the initial random back off wait time is determined
	The first random number generated will be a number between 0 and the number specified
	here.
	If the first random back off wait time expires before the data frame is sent, a retry counter
	until the size of the random back off value reaches the number defined in the Maximum
	Contention Window.
	Valid values for cwMin are 1, 3, 7, 15, 31, 63, 127, 255, 511, or 1024. The value for cwMin
	must be lower than the value for cwMax.
cwMax (Maximum	The value specified for the Maximum Contention Window is the upper limit (in milliseconds)
Contention window)	frame is sent or the Maximum Contention Window size is reached.
	Once the Maximum Contention Window size is reached, retries will continue until a
	maximum number of retries allowed is reached.
	Valid values for cwMax are 1, 3, 7, 15, 31, 63, 127, 255, 511, or 1024. The value for cwMax
Max Burst Length	The Max Burst Length is an AP EDCA parameter and only applies to traffic flowing from
Max. Barst Longin	the AP to the client station.
	This value specifies (in milliseconds) the maximum burst length allowed for packet bursts
	on the wireless network. A packet burst is a collection of multiple frames transmitted without
	performance
	Valid values for maximum burst length are 0.0 through 999.
Wi-Fi Multimedia (WN	IM) Settings
Wi-Fi MultiMedia	Wi-Fi MultiMedia (WMM) is enabled by default. With WMM enabled, QoS prioritization and
(WMM)	coordination of wireless medium access is on. With WMM enabled, QoS settings on the
	and the <i>unstream</i> traffic flowing from the station to the AP (station EDCA parameters)
	Disabling WMM deactivates QoS control of station EDCA parameters on <i>upstream</i> traffic
	flowing from the station to the AP.
	With WMM disabled, you can still set some parameters on the <i>downstream</i> traffic flowing
	To disable WMM extensions, click Disabled .
	To enable WMM extensions, click Enabled .
Station EDCA Parame	eters
Queue	Queues are defined for different types of data transmitted from station-to-AP:
	•) Data 0 (Voice) — Highest priority queue, minimum delay. Time-sensitive data such as
	•) Data 1(Video) — Highest priority queue, minimum delay. Time-sensitive video data is
	automatically sent to this queue.
	•) Data 2 (Best Effort) — Medium priority queue, medium throughput and delay. Most
	traditional IP data is sent to this queue.
	requires maximum throughput and is not time-sensitive is sent to this queue (FTP
	data, for example).
AIFS (Inter-Frame	The Arbitration Inter-Frame Spacing (AIFS) specifies a wait time for data frames. The wait
Space)	time is measured in slots. Valid values for AIFS are 1 through 255.

Field	Description
cwMin (Minimum Contention Window)	This parameter is used by the algorithm that determines the initial random back off wait time (window) for retry of a data transmission during a period of contention for Unified Access Point resources. The value specified here in the Minimum Contention Window is the upper limit (in milliseconds) of a range from which the initial random back off wait time will be determined. The first random number generated will be a number between 0 and the number specified here. If the first random back off wait time expires before the data frame is sent, a retry counter is incremented and the random back off value (window) is doubled. Doubling will continue until the size of the random back off value reaches the number defined in the Maximum Contention Window.
cwMax (Maximum Contention Window)	The value specified here in the Maximum Contention Window is the upper limit (in milliseconds) for the doubling of the random back off value. This doubling continues until either the data frame is sent or the Maximum Contention Window size is reached. Once the Maximum Contention Window size is reached, retries will continue until a maximum number of retries allowed is reached.
TXOP Limit	The TXOP Limit is a station EDCA parameter and only applies to traffic flowing from the client station to the AP. The Transmission Opportunity (TXOP) is an interval of time, in milliseconds, when a WME client station has the right to initiate transmissions onto the wireless medium (WM) towards the Unified Access Point. The TXOP Limit maximum value is 65535.
Other QoS Settings	
No Acknowledgement	Select On to specify that the AP should not acknowledge frames with QosNoAck as the service class value.
APSD	Select On to enable Automatic Power Save Delivery (APSD), which is a power management method. APSD is recommended if VoIP phones access the network through the AP.

	Note: After you configure the QoS settings, you must click Apply to apply the changes and to save
A Ster	the settings. Changing some settings might cause the AP to stop and restart system processes. If
	this happens, wireless clients will temporarily lose connectivity. We recommend that you change
	AP settings when WLAN traffic is low.

Table 44 - QoS Settings

Configuring Email Alert

The Email Alert feature allows the AP to automatically send email messages when an event at or above the configured severity level occurs. Use the Email Alert Configuration page to configure mail server settings, to set the severity level that triggers alerts, and to add up to three email addresses where urgent and non-urgent email alerts are sent.

Note: Email alert is operationally disabled when the AP transitions to managed mode.

Email Alerts Confi	guration	
Email Alerts Global Con	figuration	
Admin Node	Disabled *	
From Address		
Log Duration	30	minutes (range 30 to 1440)
Urgent Message Severity	Alert -	
Non Urgent Severity	Warning *

To Address 1		
To Address 2		
To Address 3		
Email Subject	Log message from a	AP
Update	Test Mail	

Figure 42 - Email Alerts Configuration

Field	Description				
Email Alert Global Configuration					
Admin Mode	Globally enable or disable the Email Alert feature on the AP. By default, email alerts are disabled.				
From Address	Specify the email address that appears in the <i>From</i> field of alert messages sent from the AP, for example dlinkAP23@foo.com. The address can be a maximum of 255 characters and can contain only printable characters. By default, no address is configured.				
Log Duration	This duration, in minutes, determines how frequently the non-critical messages are sent to the SMTP Server. The range is 30-1440 minutes. The default is 30 minutes.				
Urgent Message Severity	Configures the severity level for log messages that are considered to be urgent. Messages in this category are sent immediately. The security level you select and all higher levels are urgent: •) Emergency indicates system is unusable. It is the highest level of severity. •) Alert indicates action must be taken immediately. •) Critical indicates critical conditions. •) Error indicates error conditions. •) Warning indicates warning conditions. •) Notice indicates normal but significant conditions. •) Info indicates informational messages. •) Debug indicates debug-level messages.				
Non Urgent Severity	Configures the severity level for log messages that are considered to be non-urgent. Messages in this category are collected and sent in a digest form at the time interval specified by the Log Duration field. The security level you select and all levels up to, but not including the lowest Urgent level are considered non-urgent. Messages below the security level you specify are not sent via email. See the Urgent Message field description for information about the security levels.				
Email Alert Mail Serv	er Configuration				
Mail Server Address	Specify the IP address or hostname of the SMTP server on the network.				
Mail Server Security	Specify whether to use SMTP over SSL (TLSv1) or no security (Open) for authentication with the mail server. The default is Open .				
Mail Server Port	Configures the TCP port number for SMTP. The range is a valid port number from 0 to 65535. The default is 25 , which is the standard port for SMTP.				
Username	Specify the user name to use when authentication with the mail server is required. The user name is a 64-byte character string with all printable characters. The default is admin .				
Password	Specify the password associated with the user name configured in the previous field.				
Email Alert Message	Configuration				

Field	Description
To Address 1	Configure the first email address to which alert messages are sent. The address must be a valid email address. By default, no address is configured.
To Address 2	Optionally, configure the second email address to which alert messages are sent. The address must be a valid email address. By default, no address is configured.
To Address 3	Optionally, configure the third email address to which alert messages are sent. The address must be a valid email address. By default, no address is configured.
Email Subject	Specify the text to be displayed in the subject of the email alert message. The subject can contain up to 255 alphanumeric characters. The default is Log message from AP .

Table 45 - Email Alert Configuration

Note: After you configure the Email Alert settings, click **Apply** to apply the changes and to save the settings.

To validate the configured email server credentials, click **Test Mail**. You can send a test email once the email server details are configured.

The following text shows an example of an email alert sent from the AP to the network administrator:

```
From: AP-192.168.2.10@mailserver.com
Sent: Wednesday, July 08, 2011 11:16 AM
To: administrator@mailserver.com
Subject: log message from AP
TIME Priority Process Id Message
Jul 8 03:48:25 info login[1457] root login on `ttyp0'
Jul 8 03:48:26 info mini_http-ssl[1175] Max concurrent connections of 20 reached
```

Enabling the Time Settings (NTP)

Use the **Time Settings** page to specify the Network Time Protocol (NTP) server to use to provide time and date information to the AP or to configure the time and date information manually.

NTP is an Internet standard protocol that synchronizes computer clock times on your network. NTP servers transmit Coordinated Universal Time (UTC, also known as Greenwich Mean Time) to their client systems. NTP sends periodic time requests to servers, using the returned time stamp to adjust its clock. The timestamp is used to indicate the date and time of each event in log messages.

See http://www.ntp.org for more information about NTP.

To set the system time either manually or by specifying the address of the NTP server for the AP to use, click the **Services > Time Settings (NTP)** tab and update the fields as described in the table below.

Modify to discover the t	time for access point
System Time (24 HR)	Mon Apr 16 2012 11:32:00 UCT
Set System Time	Using Network Time Protocol (NTP) Manuelly
System Date	April • 16 • 2012 •
System Time (24 HR)	11 * : 32 *
Time Zone	Taiwan 🔹
Adjust Time for Daylight Savings	
Click "Apply" to save the new settings Apply	n.

Figure 43 - Time Settings (NTP)

Field	Description
Set System Time	 NTP provides a way for the AP to obtain and maintain its time from a server on the network. Using an NTP server gives your AP the ability to provide the correct time of day in log messages and session information. Choose to use a network time protocol (NTP) server to determine the system time, or set the system time manually: •) To permit the AP to poll an NTP server, click Using Network Time Protocol (NTP). •) To prevent the AP from polling an NTP server, click Manually.
NTP Server (Use NTP)	 If NTP is enabled, specify the NTP server to use. You can specify the NTP server by hostname or IP address, although using the IP address is not recommended as these can change more readily. If you specify a hostname, note the following requirements: The length must be between 1 – 63 characters. Upper and lower case characters, numbers, and hyphens are accepted. The first character must be a letter (a–z or A–Z), and the last character cannot be a hyphen.
System Date (Manual configuration)	Specify the current month, day, and year.
System Time (Manual configuration)	Specify the current time in hours and minutes. The system uses a 24-hour clock, so 6:00 PM is configured as 18:00.
Time Zone	Select your local time zone from the menu. The default is USA (Pacific).
Adjust Time for Daylight Savings	Select to have the system adjust the reported time for Daylight Savings Time (DST). When this field is selected, fields to configure Daylight Savings Time settings appear.
DST Start (24 HR)	Configure the date and time to begin Daylight Savings Time for the System Time.
DST End (24 HR)	Configure the date and time to end Daylight Savings Time for the System Time.
DST Offset (minutes)	Select the number of minutes to offset DST. The default is 60 minutes.

Table 46 - NTP Settings

Note: After you configure the Time settings, you must click **Apply** to apply the changes and to save the settings. Changing some settings might cause the AP to stop and restart system processes. If this happens, wireless clients will temporarily lose connectivity. We recommend that you change AP settings when WLAN traffic is low.

Section 6 - Configuring SNMPv3

This section describes how to configure the SNMPv3 settings on the UAP and contains the following subsections:

- •) "Configuring SNMPv3 Views" on page 80
- •) "Configuring SNMPv3 Groups" on page 81
- •) "Configuring SNMPv3 Users" on page 82
- •) "Configuring SNMPv3 Targets" on page 83

Configuring SNMPv3 Views

A MIB view is a combination of a set of view subtrees or a family of view subtrees where each view subtree is a subtree within the managed object naming tree. You can create MIB views to control the OID range that SNMPv3 users can access.

A MIB view called "all" is created by default in the system. This view contains all management objects supported by the system.

SNMPv3 V	iews Confi	guration.		
View Name	Туре	OID	Mask	
	included •	•		Add
SNMPv3 VIEWS	view-allinclu view-noneex	ded,1 kcluded,1		
	Remove			
Click "Apply" to	save the new set	ttings.		

Figure 44 - SNMPv3 Views Configuration

The following table describes the fields you can configure on the SNMPv3 Views page.

Field	Description						
View Name	Enter a name to identify the MIB view. View names can contain up to 32 alphanumeric characters.						
Туре	Specifies whether to include or exclude the view subtree or family of subtrees from the MIE view.						
OID	Enter an OID string for the subtree to include or exclude from the view. For example, the system subtree is specified by the OID string .1.3.6.1.2.1.1.						
Mask	The OID mask is 47 characters in length. The format of the OID mask is xx.xx.xx (.) or xx:xx:xx (:) and is 16 octets in length. Each octet is 2 hexadecimal characters separated by either . (period) or : (colon). Only hex characters are accepted in this field. For example, OID mask FA.80 is 11111010.10000000. A family mask is used to define a family of view subtrees. The family mask indicates which sub-identifiers of the associated family OID string are significant to the family's definition. A family of view subtrees allows control access to one row in a table, in a more efficient manner.						
SNMPv3 Views	This field shows the MIB views on the UAP. To remove a view, select it and click Remove .						

Table 47 - SNMPv3 Views

Note: After you configure the SNMPv3 Views settings, you must click **Apply** to apply the changes and to save the settings.

Configuring SNMPv3 Groups

SNMPv3 groups allow you to combine users into groups of different authorization and access privileges.

By default, the UAP has two groups:

- •) RO A read-only group using authentication and data encryption. Users in this group use an MD5 key/ password for authentication and a DES key/password for encryption. Both the MD5 and DES key/passwords must be defined. By default, users of this group will have read only access to the default all MIB view, which can be modified by the user.
- •) **RW** A read/write group using authentication and data encryption. Users in this group use an MD5 key/ password for authentication and a DES key/password for encryption. Both the MD5 and DES key/passwords must be defined. By default, users of this group will have read and write access to the default all MIB view, which can be modified by the user.

RW and RO groups are defined by default.

Note: The UAP supports maximum of eight groups.

To define additional groups, navigate to the **SNMPv3 Groups** page and configure the settings that the table below describes.

SNMPv3 G	Froups Configuration.			
Name	Security Level	Write Views	Read Views	
	noAuthentication-noPrivacy	view-all 🔻	view-all	✓ Add
SNMPv3 GROUPS	³ RCauthPrivview-nonsview RWauthPrivview-allview-al	-all I		
	Remove			
Click "Apply" to	save the new settings.			

Figure 45 - SNMPv3 Groups Configuration

Field	Description
Name	Specify a name to use to identify the group. The default group names are RW and RO. Group names can contain up to 32 alphanumeric characters.
Security Level	 Select one of the following security levels for the group: noAuthentication-noPrivacy — No authentication and no data encryption (no security). Authentication-noPrivacy — Authentication, but no data encryption. With this security level, users send SNMP messages that use an MD5 key/password for authentication, but not a DES key/password for encryption. Authentication-Privacy — Authentication and data encryption. With this security level, users send an MD5 key/password for authentication and data encryption. With this security level, users send an MD5 key/password for authentication and a DES key/password for encryption. For groups that require authentication, encryption, or both, you must define the MD5 and DES key/passwords on the SNMPv3 Users page.
Write Views	 Select the write access to management objects (MIBs) for the group: •) write-all — The group can create, alter, and delete MIBs. •) write-none — The group is not allowed to create, alter, or delete MIBS.

Field	Description
Read Views	 Select the read access to management objects (MIBs) for the group: •) view-all — The group is allowed to view and read all MIBs. •) view-none — The group cannot view or read MIBs.
SNMPv3 Groups	This field shows the default groups and the groups that you have defined on the AP. To remove a group, select the group, and click Remove .

Table 48 - SNMPv3 Groups

Note: After you configure the SNMPv3 Groups settings, you must click **Apply** to apply the changes and to save the settings.

Configuring SNMPv3 Users

From the **SNMPv3 Users** page, you can define multiple users, associate the desired security level to each user, and configure security keys.

For authentication, only MD5 type is supported, and for encryption only DES type is supported. There are no default SNMPv3 users on the UAP.

SNMPv3	Jser Co	onfi	guration.			
Name	Group		Authentication type	Authentication Key	Encryption Type	Encryption Key
	RO		MD5	•	DES	•
Add						
SNMPv3 USERS						
		_				
	Remove					
Click "Apply" to	save the	new s	settings.			
Apply						

Figure 46 - SNMPv3 User Configuration

The following table describes the fields to configure SNMPv3 users.

Field	Description
Name	Enter the user name to identify the SNMPv3 user. User names can contain up to 32 alphanumeric characters.
Group	Map the user to a group. The default groups are RWAuth , RWPriv , and RO . You can define additional groups on the SNMPv3 Groups page.
Authentication Type	 Select the type of authentication to use on SNMP requests from the user: •) MD5 — Require MD5 authentication on SNMPv3 requests from the user. •) None — SNMPv3 requests from this user require no authentication.
Authentication Key	If you specify MD5 as the authentication type, enter a password to enable the SNMP agent to authenticate requests sent by the user. The passphrase must be between 8 and 32 characters in length.
Encryption Type	 Select the type of privacy to use on SNMP requests from the user: •) DES — Use DES encryption on SNMPv3 requests from the user. •) None — SNMPv3 requests from this user require no privacy.
Encryption Key	If you specify DES as the privacy type, enter a key to use to encrypt the SNMP requests. The passphrase must be between 8 and 32 characters in length.
SNMPv3 Users	This field shows the users that you have defined on the AP. To remove a user, select the user and click Remove .

Table 49 - SNMPv3 Users

Use the buttons on the page to perform the following tasks:

- •) Add: Add the new user to the SNMPv3 users table.
- •) **Remove**: Remove the selected user from the SNMPv3 users table.
- •) Update: Apply and save the changed SNMPv3 user settings.

Note: After you configure the SNMPv3 Users settings, you must click **Apply** to apply the changes and to save the settings.

Configuring SNMPv3 Targets

SNMPv3 Targets send "inform" messages to the SNMP manager. Each target is identified by a target name and associated with target IP address, UDP port, and SNMP user name.

SNMPv3 Tar	gets Configu	iration.	
IPv4/IPv6 Address	Port	Users	
			(
		-	Add
SNMPV3 TARGETS			
l	Remove		
Click "Apply" to sav	e the new settings.		
Apply			

Figure 47 - SNMPv3 Targets Configuration

Field	Description					
IPv4/IPv6 Address Enter the IP address of the remote SNMP manager to receive the target.						
Port	Enter the UDP port to use for sending SNMP targets.					
Users	Select the name of the SNMP user to associate with the target. To configure SNMP users, see "Configuring SNMPv3 Users" on page 82.					
SNMPv3 Targets	This field shows the SNMPv3 Targets on the UAP. To remove a target, select it, and click Remove .					

Table 50 - SNMPv3 Targets

Note: After you configure the SNMPv3 Target settings, you must click **Apply** to apply the changes and to save the settings.

Section 7 - Maintaining the Access Point

This section describes how to maintain the UAP.

From the UAP Administrator UI, you can perform the following maintenance tasks:

- •) "Saving the Current Configuration to a Backup File" on page 84
- •) "Restoring the Configuration from a Previously Saved File" on page 85
- •) "Rebooting the Access Point" on page 86
- •) "Performing AP Maintenance" on page 86
- •) "Resetting the Factory Default Configuration" on page 86
- •) "Upgrading the Firmware" on page 86
- •) "Packet Capture Configuration and Settings" on page 88
- •) "Support Information Configuration and Settings" on page 92

Saving the Current Configuration to a Backup File

The AP configuration file is in XML format and contains all of the information about the AP settings. You can download the configuration file to a management station to manually edit the content or to save as a back-up copy.

You can use HTTP or TFTP to transfer files to and from the UAP. After you download a configuration file to the management station, you can manually edit the file, which is in XML format. Then, you can upload the edited configuration file to apply those configuration settings to the AP.

Use the following steps to save a copy of the current settings on an AP to a backup configuration file by using TFTP:

1.) Select **TFTP** for **Download Method**.

Manage this Access Point's Configuration		
To Save the Current Configuration to a Back	cup File	
Click the "Download" button to save the current configuration as a backup file to your PC. To save the configuration to an external TFTP server, click the TFTP radio button and enter the TFTP server information.		
Download Method	© HTTP ♥ TFTP	
Configuration File		
Server IP		
Click "Download" to copy this AP configuration.		

Figure 48 - Manage this Access Point's Configuration - Save (TFTP)

- 2.) Enter a name (1 to 255 characters) for the backup file in the **Configuration File** field, including the .xml file name extension and the path to the directory where you want to save the file.
- 3.) Enter the Server IP address of the TFTP server.
- 4.) Click **Download** to save a copy of the file to the TFTP server.

Use the following steps to save a copy of the current settings on an AP to a backup configuration file by using HTTP: 1.) Select **HTTP** for **Download Method**.

Manage this Access Point's Configuration
To Save the Current Configuration to a Backup File
Click the "Download" button to save the current configuration as a backup file to your PC. To save the configuration to an external TFTP server, click the TFTP radio button and enter the TFTP server information.
Download Method @ HTTP C TFTP
Click "Download" to copy this AP configuration. Download

2.) Click the **Download** button.

A dialog box displays verifying the download.

Figure 50 - Confirmation Prompt

- 3.) To proceed with the download, select **OK**.
 - A dialog box opens allowing you to view or save the file.
- 4.) Select the Save File option and select OK.
- 5.) Use the file browser to navigate to the directory where you want to save the file, and click **OK** to save the file. You can keep the default file name (config.xml) or rename the backup file, but be sure to save the file with an .xml extension.

Restoring the Configuration from a Previously Saved File

You can use HTTP or TFTP to transfer files to and from the UAP. After you download a configuration file to the management station, you can manually edit the file, which is in XML format. Then, you can upload the edited configuration file to apply those configuration settings to the AP.

Use the following procedures to restore the configuration on an AP to previously saved settings by using TFTP: 1.) Select **TFTP** for **Upload Method**.

Manage this Access Point's Configuration	
To Restore the Configuration from a	Previously Saved File
Browse to the location where your saved configu To restore from a TFTP server, dick the TFTP rac	ration file is stored and click the "Restore" button. ito button and enter the TFTP server information.
Upload Method	ФІТТ 🖲 ЧТІН 🗇
Filename	
Server IP	
Click "Restore" to load the configuration to this A	μ ^ρ .

Figure 51 - Manage this Access Point's Configuration - Restore (TFTP)

- 2.) Enter a name (1 to 255 characters) for the backup file in the **Filename** field, including the .xml file name extension and the path to the directory that contains the configuration file to upload.
- 3.) Enter the IP address of the TFTP server in the **Server IP** field.
- 4.) Click the **Restore** button.

The AP reboots. A reboot confirmation dialog and follow-on rebooting status message displays. Please wait for the reboot process to complete, which might take several minutes.

The Administration Web UI is not accessible until the AP has rebooted.

Use the following steps to save a copy of the current settings on an AP to a backup configuration file by using HTTP:

1.) Select HTTP for Upload Method.

Manage this Access Deint's Configuration
To Pactors the Configuration from a Bravioucly Saved File
To restore the coningeration from a previously saved the
Browse to the location where your saved configuration file is stored and click the "Restore" button. To restore from a TFIP server, click the TFIP radio button and enter the TFIP server information.
Upload Method 🛞 HTTP 🔿 TFTP
Configuration File browse
Click "Restore" to load the configuration to this AP.
(REGOTE)

Figure 52 - Manage this Access Point's Configuration - Restore (HTTP)

- 2.) Use the **Browse** button to select the file to restore.
- 3.) Click the Restore button.

A File Upload or Choose File dialog box displays.

- 4.) Navigate to the directory that contains the file, then select the file to upload and click **Open**. (Only those files created with the Backup function and saved as .xml backup configuration files are valid to use with Restore; for example, ap config.xml.)
- 5.) Click the **Restore** button.
- A dialog box opens verifying the restore.
- 6.) Click OK to proceed. The AP reboots. A reboot confirmation dialog and follow-on rebooting status message displays. Please wait for the reboot process to complete, which might take several minutes. The Administration Web UI is not accessible until the AP has rebooted.

Rebooting the Access Point

On the **Maintenance > Configuration** page, you can reboot the UAP for maintenance purposes and for troubleshooting measures.

Performing AP Maintenance

From the Maintenance page, you can reset the AP to its factory default settings or reboot the AP.

Resetting the Factory Default Configuration

If you are experiencing problems with the UAP and have tried all other troubleshooting measures, click **Reset**. This restores factory defaults and clears all settings, including settings such as a new password or wireless settings. You can also use the reset button on the back panel to reset the system to the default configuration.

Rebooting the Access Point

For maintenance purposes or as a troubleshooting measure, you can reboot the UAP. To reboot the AP, click the **Reboot** button on the **Configuration** page.

Upgrading the Firmware

As new versions of the UAP firmware become available, you can upgrade the firmware on your devices to take advantage of new features and enhancements. The AP uses a TFTP client for firmware upgrades. You can also use HTTP to perform firmware upgrades.

After you upload new firmware and the system reboots, the newly added firmware becomes the primary image. If the upgrade fails, the original firmware remains as the primary image.

Note: When you upgrade the firmware, the access point retains the existing configuration information.

Use the following steps to upgrade the firmware on an access point by using TFTP: 1.) Select **TFTP** for **Upload Method**.

Manage firm	Manage firmware		
Model Platform Firmware Version	DWL-2600AP dwl2600ap 4.1.0.7_beta005		
Upload Method	O HTTP @ TFTP		
Image Filename	/share/builds/ap/ap_upgrade.tar		
Server IP	10.27.64.136		
	Upgrade		
Caution: Uploading the new firmware may take several minutes. Please do not refresh the page or navigate to another page while uploading the new firmware, or the firmware upload will be aborted. When the process is complete the access point will restart and resume normal operation.			

Figure 55 - Manage Firmware (TFTP)

2.) Enter a name (1 to 255 characters) for the image file in the **Image Filename** field, including the path to the directory that contains the image to upload.

For example, to upload the ap_upgrade.tar image located in the /share/builds/ap directory, enter / share/builds/ap/ap_upgrade.tar in the Image Filename field.

The firmware upgrade file supplied must be a *tar* file. Do not attempt to use *bin* files or files of other formats for the upgrade; these types of files will not work.

- 3.) Enter the Server IP address of the TFTP server.
- 4.) Click Upgrade.

Upon clicking **Upgrade** for the firmware upgrade, a popup confirmation window is displayed that describes the upgrade process.

5.) Click **OK** to confirm the upgrade and start the process.

Note: The firmware upgrade process begins once you click **Upgrade** and then **OK** in the pop-up confirmation window.

The upgrade process may take several minutes during which time the access point will be unavailable. Do not power down the access point while the upgrade is in process. When the upgrade is complete, the access point restarts. The AP resumes normal operation with the same configuration settings it had before the upgrade.

6.) To verify that the firmware upgrade completed successfully, check the firmware version shown on the **Upgrade** page (or the **Basic Settings** page). If the upgrade was successful, the updated version name or number is indicated.

Use the following steps to upgrade the firmware on an access point by using HTTP:

1.) Select HTTP for Upload Method.

Manage firm	Manage firmware		
Model Platform Firmware Version	DWL-2600AP dwl2600ap 4.1.0.7_beta005		
Upload Method New Firmware Image	HTTP TFTP Browse Upprade		
Caution: Uploading the new firmware may take several minutes. Please do not refresh the page or navigate to another page while uploading the new firmware, or the firmware upload will be aborted. When the process is complete the access point will restart and resume normal operation.			

Figure 56 - Manage Firmware (HTTP)

2.) If you know the path to the new firmware image file, enter it in the **Image Filename** field. Otherwise, click the **Browse** button and locate the firmware image file.

The firmware upgrade file supplied must be a *tar* file. Do not attempt to use *bin* files or files of other formats for the upgrade; these types of files will not work.

- Click Upgrade to apply the new firmware image. Upon clicking Upgrade for the firmware upgrade, a popup confirmation window is displayed that describes the upgrade process.
- 4.) Click **OK** to confirm the upgrade and start the process.

Note: The firmware upgrade process begins once you click **Upgrade** and then **OK** in the popup confirmation window.

The upgrade process may take several minutes during which time the access point will be unavailable. Do not power down the access point while the upgrade is in process. When the upgrade is complete, the access point restarts. The AP resumes normal operation with the same configuration settings it had before the upgrade.

5.) To verify that the firmware upgrade completed successfully, check the firmware version shown on the **Upgrade** page (or the **Basic Settings** page). If the upgrade was successful, the updated version name or number is indicated.

Packet Capture Configuration and Settings

Wireless packet capture operates in two modes:

- •) Capture file mode.
- •) Remote capture mode.

For *capture file mode*, captured packets are stored in a file on the Access Point. The AP can transfer the file to a TFTP server. The file is formatted in pcap format and can be examined using tools such as Wireshark and OmniPeek.

For *remote capture mode*, the captured packets are redirected in real time to an external PC running the Wireshark[®] tool.

The AP can capture the following types of packets:

- •) 802.11 packets received and transmitted on radio interfaces. Packets captured on radio interfaces include the 802.11 header.
- •) 802.3 packets received and transmitted on the Ethernet interface.
- •) 802.3 packets received and transmitted on the internal logical interfaces such as VAPs and WDS interfaces.

From the Packet Capture Configuration and Settings page, you can:

- •) View the current packet capture status.
- •) Configure packet capture parameters.
- •) Configure packet file capture.
- •) Configure a remote capture port.
- •) Download a packet capture file.

Figure 57 - Packet Capture Configuration & Settings

Packet Capture Status

Packet Capture Status allows you to view the status of packet capture on the AP.

Packet Capture Status	
Current Capture Status	Not Started
Packet Capture Time	00:00:00
Packet Capture File Size	0 KB

Figure 58 - Packet Capture Status

The following table describes information the packet capture status fields display.

Field	Description
Current Capture Status	Shows whether packet capture is running or stopped.
Packet Capture Time	Shows elapsed capture time.
Packet Capture File Size	Shows the current capture file size.

Table 51 - Packet Capture Status

Packet Capture Parameter Configuration

Packet Capture Configuration allows you to configure parameters that affect how packet capture functions on the radio interfaces.

Figure 59 - Packet Capture Configuration

The following table describes the fields to configure the packet capture.

Field	Description
Capture Beacons	Enable to capture the 802.11 beacons detected or transmitted by the radio.
Promiscuous Capture	Enable to place the radio in promiscuous mode when the capture is active. In promiscuous mode the radio receives all traffic on the channel, including traffic that is not destined to this AP. While the radio is operating in promiscuous mode, it continues serving associated clients. Packets not destined to the AP are not forwarded. As soon as the capture is completed, the radio reverts to non-promiscuous mode operation.
Client Filter Enable	Enable to use the WLAN client filter to capture only frames that are transmitted to, or received from a WLAN client with a specified MAC address.
Client Filter MAC Address	Specify a MAC address for WLAN client filtering. Note: The MAC filter is active only when capture is performed on an 802.11 interface.

Table 52 - Packet Capture Configuration

Note: Changes to packet capture configuration parameters take affect after packet capture is restarted. Modifying the parameters while the packet capture is running doesn't affect the current packet capture session. In order to begin using new parameter values, an existing packet capture capture be stored and an attended.
session must be stopped and re-started.

Packet File Capture

In Packet File Capture mode the AP stores captured packets in the RAM file system.

Upon activation, the packet capture proceeds until one of the following occurs:

- •) The capture time reaches configured duration.
- •) The capture file reaches its maximum size.
- •) The administrator stops the capture.

During the capture, you can monitor the capture status, elapsed capture time, and the current capture file size. This information can be updated, while the capture is in progress, by clicking **Refresh**.

Packet File Capture	·	
Capture Interface	•	
Capture Duration	60	Seconds (range 10 to 3600)
Max Capture File Size	1024	KB (range 64 to 4096)
Click "Apply" to save the Apply	new settings.	Start File Capture

Figure 60 - Packet File Capture

The following table describes the fields to configure the packet capture status.

Field	Description
Capture Interface	Select an AP Capture Interface name from the drop-down menu. AP capture interface
	names are eligible for packet capture are:
	brtrunk - Linux bridge interface in the AP
	eth0 - 802.3 traffic on the Ethernet port.
	•) wlan0 - VAP0 traffic on radio 1.
	•) wlan1 - VAP0 traffic on radio 2.
	•) radio1 - 802.11 traffic on radio 1.
	radio2 - 802.11 traffic on radio 2.
	 wlan0vap1 to wlan0vap15. Traffic on the specified VAP on Radio 1.
	 wlan1vap1 to wlan1vap 15. Traffic on the specified VAP on Radio 2.
	 wlan0wds0 to wlan0wds3. Traffic on the specified WDS interface.
Capture Duration	Specify the time duration in seconds for the capture (range 10 to 3600).
Max Capture File Size	Specify the maximum allowed size for the capture file in KB (range 64 to 4096).

Table 53 - Packet File Capture

Remote Packet Capture

Remote Packet Capture allows you to specify a remote port as the destination for packet captures. This feature works in conjunction with the Wireshark network analyzer tool for Windows. A packet capture server runs on the AP and sends the captured packets via a TCP connection to the Wireshark tool.

A Windows PC running the Wireshark tool allows you to display, log, and analyze captured traffic.

When the remote capture mode is in use, the AP doesn't store any captured data locally in its file system.

Your can trace up to five interfaces on the AP at the same time. However, you must start a separate Wireshark session for each interface. You can configure the IP port number used for connecting Wireshark to the AP. The default port number is 2002. The system uses 5 consecutive port numbers starting with the configured port for the packet capture sessions.

If a firewall is installed between the Wireshark PC and the AP, these ports must be allowed to pass through the firewall. The firewall must also be configured to allow the Wireshark PC to initiate TCP connection to the AP.

To configure Wireshark to use the AP as the source for captured packets, you must specify the remote interface in the

"Capture Options" menu. For example to capture packets on an AP with IP address 192.168.1.10 on radio 1 using the default IP port, specify the following interface: rpcap://192.168.1.10/radio1

To capture packets on the Ethernet interface of the AP and VAP0 on radio 1 using IP port 58000, start two Wireshark sessions and specify the following interfaces:

rpcap://192.168.1.10:58000/eth0 rpcap://192.168.1.10:58000/wlan0

When you are capturing traffic on the radio interface, you can disable beacon capture, but other 802.11 control frames are still sent to Wireshark. You can set up a display filter to show only:

- •) Data frames in the trace
- •) Traffic on specific BSSIDs
- •) Traffic between two clients

Some examples of useful display filters are:

- •) Exclude beacons and ACK/RTS/CTS frames:
- !(wlan.fc.type_subtype == 8 || wlan.fc.type == 1)
- •) Data frames only: wlan.fc.type == 2
- •) Traffic on a specific BSSID:
- wlan.bssid == 00:02:bc:00:17:d0
 All traffic to and from a specific client:
 - wlan.addr == 00:00:e8:4e:5f:8e

In remote capture mode, traffic is sent to the PC running Wireshark via one of the network interfaces. Depending on where the Wireshark tool is located the traffic can be sent on an Ethernet interface or one of the radios. In order to avoid a traffic flood caused by tracing the trace packets, the AP automatically installs a capture filter to filter out all packets destined to the Wireshark application. For example if the Wireshark IP port is configured to be 58000 then the following capture filter is automatically installed on the AP:

not portrange 58000-58004.

Enabling the packet capture feature impacts performance of the AP and can create a security issue (unauthorized clients may be able to connect to the AP and trace user data). The AP performance is negatively impacted even if there is no active Wireshark session with the AP. The performance is negatively impacted to a greater extent when packet capture is in progress.

Due to performance and security issues, the packet capture mode is not saved in NVRAM on the AP; if the AP resets, the capture mode is disabled and the you must re-enable it in order to resume capturing traffic. Packet capture parameters (other than mode) are saved in NVRAM.

In order to minimize performance impact on the AP while traffic capture is in progress, you should install capture filters to limit which traffic is sent to the Wireshark tool. When capturing 802.11 traffic, large portion of the captured frames tend to be beacons (typically sent every 100ms by all Access Points). Although Wireshark supports a display filter for beacon frames, it does not support a capture filter to prevent the AP from forwarding captured beacon packets to the Wireshark tool. In order to reduce performance impact of capturing the 802.11 beacons, you can disable the capture beacons mode.

The remote packet capture facility is a standard feature of the Wireshark tool for Windows.

Note: Remote packet capture is not standard on the Linux version of Wireshark; the Linux version doesn't work with the AP.

Wireshark is an open source tool and is available for free; it can be downloaded from http://www.wireshark.org.

Figure 61 - Remote Packet Capture

The following table describes the fields to configure the packet capture status.

Field	Description
Remote Capture	Specify the remote port to use as the destination for packet captures. (range 1 to 65530).
Port	Note: For DWL-XX10AP models, the port range is from 1025 to 65530.

Table 54 - Remote Packet Capture

Packet Capture File Download

Packet Capture File Download allows you to download the capture file by TFTP to a configured TFTP server or by HTTP(S) to a PC. The captured packets are stored in file /tmp/apcapture.pcap on the AP. A capture is automatically stopped when the capture file download command is triggered.

Because the capture file is located in the RAM file system, it disappears if the AP is reset.

Packet Capture File	Packet Capture File Download		
Use TFTP to download t	he capture file		
TFTP Server Filename	apcapture.pcap		
Server IP	0.0.0.0		
		Download	

Figure 62 - Packet Capture File Download

The following table describes the fields to configure the packet capture status.

Field	Description
Use TFTP to download the capture file	 Select or clear this option to determine whether to use TFTP or HTTP(S) to download the capture file: •) To download the file by using TFTP, select this option and complete the additional fields. •) To download the file by using HTTP or HTTPS, clear this option and click Download to browse to the location where the file is to be saved.
TFTP Server Filename	When using TFTP to download the file, specify a name for the packet capture file, including the .pcap file name extension and the path to the directory where you want to save the file.
Server IP	When using TFTP to download the file, specify the IP address of the TFTP server.

Table 56 - Support Information

Section 8 - Configuring Client Quality of Service (QoS)

This section describes how to configure QoS settings that affect traffic from the wireless clients to the AP. By using the UAP Client QoS features, you can limit bandwidth and apply ACLs and DiffServ policies to the wireless interface. If a VAP uses WPA Enterprise security to authenticate clients, you can configure the RADIUS server to provide per-client QoS information.

This section describes the following features:

- •) "Configuring VAP QoS Parameters" on page 93
- •) "Managing Client QoS ACLs" on page 94
- •) "Creating a DiffServ Class Map" on page 100
- •) "Creating a DiffServ Policy Map" on page 105
- •) "Configuring RADIUS-Assigned Client QoS Parameters" on page 107

Configuring VAP QoS Parameters

The client QoS features on the UAP provide additional control over certain QoS aspects of wireless clients that connect to the network, such as the amount of bandwidth an individual client is allowed to send and receive. To control general categories of traffic, such as HTTP traffic or traffic from a specific subnet, you can configure ACLs and assign them to one or more VAPs.

In addition to controlling general traffic categories, Client QoS allows you to configure per-client conditioning of various micro-flows through Differentiated Services (DiffServ). DiffServ policies are a useful tool for establishing general micro-flow definition and treatment characteristics that can be applied to each wireless client, both inbound and outbound, when it is authenticated on the network.

From the **VAP QoS Parameters** page, you can enable the Client QoS feature, specify client bandwidth limits, and select the ACLs and DiffServ policies to use as default values for clients associated with the VAP when the client does not have their own attributes defined by a RADIUS server.

To configure the Client QoS administrative mode and to configure the QoS settings for a VAP, click the **VAP QoS Parameters** tab.

onfigure Client	QoS VAP	Settings		 _

	-			

Figure 64 - Configure Client QoS VAP Settings

Field	Description
Client QoS Global Admin Mode	Enable or disable Client QoS operation on the AP. Changing this setting will not affect the WMM settings you configure on the QoS page.
Radio	For dual-radio APs, select Radio 1 or Radio 2 to specify which radio to configure.
VAP	Specify the VAP that will have the Client QoS settings that you configure. The QoS settings you configure for the selected VAP will not affect clients that access the network through other VAPs.

Field	Description
Client QoS Mode	Enable or disable QoS operation on the VAP selected in the VAP menu. QoS must be enabled globally (from the Client QoS Global Admin Mode field) and on the VAP (QoS Mode field) for the Client QoS settings to be applied to wireless clients.
Bandwidth Limit Down	Enter the maximum allowed transmission rate from the AP to the wireless client in bits per second. The valid range is $0 - 429496000$ bits/sec. The value you enter must be a multiple of 8000 bits/sec, in other words, the value must be $n \times 8000$ bits/sec, where $n = 0, 1, 2, 3$ If you attempt to set the limit to a value that is not a multiple of 8000 bits/sec, the configuration will be rejected. A value of 0 means that the bandwidth maximum limit is not enforced in this direction.
Bandwidth Limit Up	Enter the maximum allowed client transmission rate to the AP in bits per second. The valid range is $0 - 4294967295$ bps. The value you enter must be $n \times 8000$ bits/sec, where $n = 0, 1, 2, 3$ If you attempt to set the limit to a value that is not a multiple of 8000 bits/sec, the configuration will be rejected. A value of 0 means that the bandwidth maximum limit is not enforced in this direction.
ACL Type Down	 Select the type of ACL to apply to traffic in the outbound (down) direction, which can be one of the following: •) IPv4: The ACL examines IPv4 packets for matches to ACL rules •) IPv6: The ACL examines IPv6 packets for matches to ACL rules •) MAC: The ACL examines layer 2 frames for matches to ACL rules
ACL Name Down	Select the name of the ACL applied to traffic in the outbound (down) direction. After switching the packet or frame to the outbound interface, the ACL's rules are checked for a match. The packet or frame is transmitted if it is permitted, and discarded if it is denied.
ACL Type Up	 Select the type of ACL to apply to traffic in the inbound (up) direction, which can be one of the following: IPv4: The ACL examines IPv4 packets for matches to ACL rules IPv6: The ACL examines IPv6 packets for matches to ACL rules MAC: The ACL examines layer 2 frames for matches to ACL rules
ACL Name Up	Select the name of the ACL applied to traffic entering the AP in the inbound (up) direction. When a packet or frame is received by the AP, the ACL's rules are checked for a match. The packet or frame is processed if it is permitted, and discarded if it is denied.
DiffServ Policy Down	Select the name of the DiffServ policy applied to traffic from the AP in the outbound (down) direction.
DiffServ Policy Up	Select the name of the DiffServ policy applied to traffic sent to the AP in the inbound (up) direction

Table 57 - VAP QoS Parameters

Managing Client QoS ACLs

ACLs are a collection of permit and deny conditions, called rules, that provide security by blocking unauthorized users and allowing authorized users to access specific resources. ACLs can block any unwarranted attempts to reach network resources.

The UAP supports up to 50 IPv4, IPv6, and MAC ACLs.

IPv4 and IPv6 ACLs

IP ACLs classify traffic for Layers 3 and 4.

Each ACL is a set of up to 10 rules applied to traffic sent from a wireless client or to be received by a wireless client. Each rule specifies whether the contents of a given field should be used to permit or deny access to the network. Rules can be based on various criteria and may apply to one ore more fields within a packet, such as the source or destination IP address, the source or destination L4 port, or the protocol carried in the packet.

MAC ACLs

MAC ACLs are Layer 2 ACLs. You can configure the rules to inspect fields of a frame such as the source or destination MAC address, the VLAN ID, or the Class of Service 802.1p priority. When a frame enters or exits the AP port (depending on whether the ACL is applied in the up or down direction), the AP inspects the frame and checks the ACL rules against the content of the frame. If any of the rules match the content, a permit or deny action is taken on the frame.

ACL Configuration Process

Configure ACLs and rules on the **Client QoS ACL** page (steps 1–5), and then apply the rules to a specified VAP on the **AP QoS Parameters** page (step 6).

Use the following general steps to configure ACLs:

- 1.) Specify a name for the ACL.
- 2.) Select the type of ACL to add.
- 3.) Add the ACL.
- 4.) Add new rules to the ACL.
- 5.) Configure the match criteria for the rules.
- 6.) Apply the ACL to one or more VAPs.

To configure an ACL, click the **Client QoS ACL** tab.

The fields to configure ACL rules appear only after you have created an ACL. The following image shows the configuration of a new rule for the IPv4 ACL named acl1. The rule prevents HTTP traffic from all clients in the 192.168.20.0 network from being forwarded.

Figure 65 - Configure Client QoS ACL Settings

The following table describes the fields available on the **Client QoS ACL** page.

Field	Description
ACL Configuration	
ACL Name	Enter a name to identify the ACL. The name can contain from 1 – 31 alphanumeric characters. Spaces are not allowed.

Field	Description			
ACL Type	Select the type of ACL to configure:			
	•) IPv4			
	•) IPv6			
	•) MAC			
	IPv4 and IPv6 ACLs control access to network resources based on Layer 3 and Layer 4			
	criteria. MAC ACLS control access based on Layer 2 criteria.			
ACL Rule Configurat				
ACL Name - ACL	Select the ACL to configure with the new rule. The list contains all ACLs added in the ACL			
Туре	Configuration section.			
Rule	To configure a new rule to add to the selected ACL, select New Rule . To add an existing rule			
	to an ACL or to modify a rule, select the rule number.			
	which you add them to the ACL. There is an implicit deny all rule as the final rule			
Action	Specifies whether the ACL rule permits or denies an action			
ACION	•) When you select Permit , the rule allows all traffic that meets the rule criteria to enter or			
	exit the AP (depending on the ACL direction you select). Traffic that does not meet the			
	criteria is dropped.			
	•) When you select Deny , the rule blocks all traffic that meets the rule criteria from			
	entering or exiting the AP (depending on the ACL direction you select). Traffic that			
	does not meet the criteria is forwarded unless this rule is the final rule. Because there			
	is an implicit deny all rule at the end of every ACL, traffic that is not explicitly permitted			
Match Every	Indicates that the rule, which either has a permit or deny action, will match the frame or			
	packet regardless of its contents.			
	option is selected by default for a new rule. You must clear the option to configure other			
	match fields.			
IPv4 ACL	<u>.</u>			
Protocol	Select the Protocol field to use an L3 or L4 protocol match condition based on the value of			
	the IP Protocol field in IPv4 packets or the Next Header field of IPv6 packets.			
	Once you select the field, choose the protocol to match by keyword or enter a protocol ID.			
	Select From List			
	Select one of the following protocols from the list:			
	•) ICMP			
	•) IGMP			
	•) TCP			
	•) UDP			
	Match to Value			
	To match a protocol that is not listed by name, enter the protocol ID.			
	The protocol ID is a standard value assigned by the IANA. The range is a number from			
Source IP Address	Select this field to require a packet's source IP address to match the address listed here.			
Wild Card Mask	Specifies the source IP address wildcard mask.			
	mask of 255 255 255 255 indicates that no bit is important. A wildoard of 0.0.0 indicates			
	that all of the hits are important. This field is required when Source IP Address is checked			
	A wild card mask is, in essence, the inverse of a subnet mask. For example, to match the			
	criteria to a single host address, use a wildcard mask of 0.0.0.0. To match the criteria to a			
	24-bit subnet (for example 192.168.10.0/24), use a wild card mask of 0.0.0.255.			

Field	Description
Field Source Port	 Description Select this field to include a source port in the match condition for the rule. The source port is identified in the datagram header. Once you select the field, choose the port name or enter the port number. Select From List Select the keyword associated with the source port to match:) ftp) ftpdata) http) smtp) telnet) telnet) tftp) www Each of these keywords translates into its equivalent port number. Match to Port Enter the IANA port number to match to the source port identified in the datagram header. The port range is 0 – 65535 and includes three different types of ports:) 0 – 1023: Well Known Ports) 1024 – 49151: Registered Ports
Destination IP	Select this field to require a packet's destination IP address to match the address listed here. Enter an IP address in the appropriate field to apply this criteria
Wild Card Mask	Specifies the destination IP address wildcard mask. The wild card masks determines which bits are used and which bits are ignored. A wild card mask of 255.255.255.255 indicates that no bit is important. A wildcard of 0.0.0.0 indicates that all of the bits are important. This field is required when Source IP Address is checked. A wild card mask is in essence the inverse of a subnet mask. For example, to match the criteria to a single host address, use a wildcard mask of 0.0.0.0. To match the criteria to a 24-bit subnet (for example 192.168.10.0/24), use a wild card mask of 0.0.0.255.
Destination Port	Select this field to include a destination port in the match condition for the rule. The destination port is identified in the datagram header. Once you select the field, choose the port name or enter the port number. Select From List Select the keyword associated with the destination port to match: •) ftp •) ftpdata •) http •) smtp •) smtp •) selnet •) telnet •) tftp •) www Each of these keywords translates into its equivalent port number. Match to Port Enter the IANA port number to match to the destination port identified in the datagram header. The port range is 0 – 65535 and includes three different types of ports: •) 0 – 1023: Well Known Ports •) 1024 – 49151: Registered Ports •) 49152 – 65535: Dynamic and/or Private Ports
IP DSCP	To use IP DSCP as a match criteria, select the check box and select a DSCP value keyword or enter a DSCP value to match. You can select only one service type (DSCP, IP Precedence or TOS bits) to use for match criteria. Select from List Select from a list of DSCP types. Match to Value Enter a DSCP Value to match (0 – 63).

Field	Description
IP Precedence	Select this option and enter a value to use the packet's IP Precedence value in the IP header as match criteria. You can select only one service type (DSCP, IP Precedence or TOS bits) to use for match criteria. The IP Precedence range is 0 – 7.
IP TOS Bits	Select this option and enter a value to use the packet's Type of Service bits in the IP header as match criteria. You can select only one service type (DSCP, IP Precedence or TOS bits) to use for match criteria. The IP TOS field in a packet is defined as all eight bits of the Service Type octet in the IP header. The TOS Bits value is a two-digit hexadecimal number from 00 to ff. The high-order three bits represent the IP precedence value. The high-order six bits represent the IP Differentiated Services Code Point (DSCP) value.
IP TOS Mask	Enter an IP TOS mask value to identify the bit positions in the TOS Bits value that are used for comparison against the IP TOS field in a packet. The TOS Mask value is a two-digit hexadecimal number from 00 to ff, representing an inverted (i.e. wildcard) mask. The zero-valued bits in the TOS Mask denote the bit positions in the TOS Bits value that are used for comparison against the IP TOS field of a packet. For example, to check for an IP TOS value having bits 7 and 5 set and bit 1 clear, where bit 7 is most significant, use a TOS Bits value of a0 and a TOS Mask of 00. This is an optional configuration.
IPv6 ACL	
Protocol	Select the Protocol field to use an L3 or L4 protocol match condition based on the value of the IP Protocol field in IPv4 packets or the Next Header field of IPv6 packets. Once you select the field, choose the protocol to match by keyword or enter a protocol ID. Select From List Select one of the following protocols from the list: •) IP •) ICMP •) ICMP •) ICMP •) ICMPv6 •) IGMP •) TCP •) UDP Match to Value To match a protocol that is not listed by name, enter the protocol ID. The protocol ID is a standard value assigned by the IANA. The range is a number from 0–255.
Source IPv6 Address	Select this field to require a packet's source IPv6 address to match the address listed here. Enter an IPv6 address in the appropriate field to apply this criteria.
Source IPv6 Prefix Length	Enter the prefix length of the source IPv6 address.

Field	Description
Field Source Port	Description Select this option to include a source port in the match condition for the rule. The source port is identified in the datagram header. Once you select the field, choose the port name or enter the port number. Select From List Select the keyword associated with the source port to match:) ftp) ftpdata) http) smtp) telnet) ftfp) tenet) ftfp) mww Each of these keywords translates into its equivalent port number. Match to Port Enter the IANA port number to match to the source port identified in the datagram header. The port range is 0 – 65535 and includes three different types of ports:) 0 – 1023; Well Known Ports
	 •) 1024 – 49151: Registered Ports •) 49152 – 65535: Dynamic and/or Private Ports
Destination IPv6 Address	Select this field to require a packet's destination IPv6 address to match the address listed here. Enter an IPv6 address in the appropriate field to apply this criteria.
Destination IPv6 Prefix Length	Enter the prefix length of the destination IPv6 address.
Destination Port	Select this option to include a destination port in the match condition for the rule. The destination port is identified in the datagram header. Once you select the field, choose the port name or enter the port number. Select From List Select the keyword associated with the destination port to match: •) ftp •) ftpdata •) http •) smtp •) smtp •) selnet •) telnet •) tftp •) www Each of these keywords translates into its equivalent port number. Match to Port Enter the IANA port number to match to the destination port identified in the datagram header. The port range is 0 – 65535 and includes three different types of ports: •) 0 – 1023: Well Known Ports •) 1024 – 49151: Registered Ports •) 49152 – 65535: Dynamic and/or Private Ports
IPv6 Flow Label	Flow label is 20-bit number that is unique to an IPv6 packet. It is used by end stations to signify quality-of-service handling in routers (range 0 to 1048575).
IPv6 DSCP	To use IPv6 DSCP as a match criteria, select the check box and select a DSCP value keyword or enter a DSCP value to match. You can select only one service type (DSCP, IP Precedence or TOS bits) to use for match criteria. Select from List Select from a list of DSCP types. Match to Value Enter a DSCP Value to match (0 – 63).
INIAC ACL	

Field	Description
EtherType	Select the EtherType field to compare the match criteria against the value in the header of an Ethernet frame. Select an EtherType keyword or enter an EtherType value to specify the match criteria. Select from List Select Select one of the following protocol types: •) appletalk •) arp •) ipv4 •) ipv6 •) ipx •) netbios •) pppoe Match to Value Enter a custom protocol identifier to which packets are matched. The value is a four-digit
	nexadecimal number in the range of 0600 – FFFF.
Class of Service	The valid range is 0 – 7. This field is located in the first/only 802.1Q VLAN tag.
Source MAC Address	Select this field and enter the source MAC address to compare against an Ethernet frame.
Source MAC Mask	Select this field and enter the source MAC address mask specifying which bits in the source MAC to compare against an Ethernet frame. A 0 indicates that the address bit is significant, and an f indicates that the address bit is to be ignored. A MAC mask of 00:00:00:00:00:00 matches a single MAC address.
Destination MAC Address	Select this field and enter the destination MAC address to compare against an Ethernet frame.
Destination MAC Mask	Enter the destination MAC address mask specifying which bits in the destination MAC to compare against an Ethernet frame. A 0 indicates that the address bit is significant, and an f indicates that the address bit is to be ignored. A MAC mask of 00:00:00:00:00:00 matches a single MAC address.
VLAN ID	Select this field and enter the VLAN IDs to compare against an Ethernet frame. This field is located in the first/only 802.1Q VLAN tag.

Table 58 - ACL Configuration

After you set the desired rule criteria, click **Apply**. To delete an ACL, select the **Delete ACL** option and click **Apply**.

Creating a DiffServ Class Map

The Client QoS feature contains Differentiated Services (DiffServ) support that allows traffic to be classified into streams and given certain QoS treatment in accordance with defined per-hop behaviours.

Standard IP-based networks are designed to provide *best effort* data delivery service. Best effort service implies that the network delivers the data in a timely fashion, although there is no guarantee that it will. During times of congestion, packets may be delayed, sent sporadically, or dropped. For typical Internet applications, such as e-mail and file transfer, a slight degradation in service is acceptable and in many cases unnoticeable. However, on applications with strict timing requirements, such as voice or multimedia, any degradation of service has undesirable effects.

By classifying the traffic and creating policies that define how to handle these traffic classes, you can make sure that time-sensitive traffic is given precedence over other traffic.

The UAP supports up to 50 Class Maps.

Defining DiffServ

To use DiffServ for Client QoS, use the **Class Map** and **Policy Map** pages to define the following categories and their criteria:

- •) Class: create classes and define class criteria
- •) Policy: create policies, associate classes with policies, and define policy statements

Once you define the class and associate it with a policy, apply the policy to a specified VAP on the **VAP QoS Parameters** page.

Packets are classified and processed based on defined criteria. The classification criteria is defined by a class. The processing is defined by a policy's attributes. Policy attributes may be defined on a per-class instance basis, and it is these attributes that are applied when a match occurs. A policy can contain multiple classes. When the policy is active, the actions taken depend on which class matches the packet.

Packet processing begins by testing the class match criteria for a packet. A policy is applied to a packet when a class match within that policy is found. DiffServ is supported for IPv4 and IPv6 packets.

Use the **Class Map** page to add a new Diffserv class name, or to rename or delete an existing class, and define the criteria to associate with the DiffServ class.

To configure a DiffServ Class Map, click the Class Map tab.

Note: The **Class Map** page displays the Match Criteria Configuration fields only if a Class Map has been created. To create a Class Map, enter a name in the Class Map Name field and click **Add Class Map**.

Configure Client	QoS DiffServ Class Map Settings

Figure 66 - Configure Client QoS DiffServ Class Map Settings

Field	Description	
Class Map Configuration		
Class Map Name	Enter a Class Map Name to add. The name can range from 1 to 31 alphanumeric characters.	
Match Layer 3 Protocol	Specify whether to classify IPv4 or IPv6 packets.	
Match Criteria Configuration		

Field	Description		
Class Map Name	Select name of the class to configure. Use the fields in the Match Criteria Configuration area to match packets to a class. Select the check box for each field to be used as a criterion for a class and enter data in the related field. You can have multiple match criteria in a class. Note: The match criteria fields that are available depend on whether the class map is an IPv4 or IPv6 class map.		
Match Every	Select Match Every to specify that the match condition is true to all the parameters in an L3 packet.		
Protocol	Select the Protocol field to use an L3 or L4 protocol match condition. Select the Protocol field to use an L3 or L4 protocol match condition based on the value of the IP Protocol field in IPv4 packets or the Next Header field of IPv6 packets. Once you select the field, choose the protocol to match by keyword or enter a protocol ID. Select From List Select one of the following protocols from the list: •) IP •) ICMP •) ICMP •) ICMP •) ICMPv6 •) IGMP •) IGMP •) TCP •) UDP Match to Value To match a protocol that is not listed by name, enter the protocol ID. The protocol ID is a standard value assigned by the IANA. The range is a number from 0 –		
	255.		
IPv4 Class Maps			
Source IP Address	Select this field to require a packet's source IP address to match the address listed here. Enter an IP address in the appropriate field to apply this criteria.		
Source IP Mask	Enter the source IP address mask. The mask for DiffServ is a network-style bit mask in IP dotted decimal format indicating which part(s) of the destination IP Address to use for matching against packet content. A DiffServ mask of 255.255.255.255 indicates that all bits are important, and a mask of 0.0.0.0 indicates that no bits are important. The opposite is true with an ACL wild card mask. For example, to match the criteria to a single host address, use a DiffServ mask of 255.255.255.255.255. To match the criteria to a 24-bit subnet (for example 192.168.10.0/24), use a mask of 255.255.255.0.		
Destination IP Address	Select this field to require a packet's destination IP address to match the address listed here. Enter an IP address in the appropriate field to apply this criteria.		
Destination IP Mask	Enter the destination IP address mask. The mask for DiffServ is a network-style bit mask in IP dotted decimal format indicating which part(s) of the destination IP Address to use for matching against packet content. A DiffServ mask of 255.255.255.255 indicates that all bits are important, and a mask of 0.0.0.0 indicates that no bits are important. The opposite is true with an ACL wild card mask. For example, to match the criteria to a single host address, use a DiffServ mask of 255.255.255.255.255. To match the criteria to a 24-bit subnet (for example 192.168.10.0/24), use a mask of 255.255.255.0.		
IPv6 Class Maps			
Source IPv6 Address	Select this field to require a packet's source IPv6 address to match the address listed here. Enter an IPv6 address in the appropriate field to apply this criteria.		
Source IPv6 Prefix Length	Enter the prefix length of the source IPv6 address.		
Destination IPv6 Address	Select this field to require a packet's destination IPv6 address to match the address listed here. Enter an IPv6 address in the appropriate field to apply this criteria.		
Destination IPv6 Prefix Length	Enter the prefix length of the destination IPv6 address.		
IPv6 Flow Label	Flow label is 20-bit number that is unique to an IPv6 packet. It is used by end stations to signify quality-of-service handling in routers (range 0 to 1048575).		

Field	Description
IP DSCP	To use IP DSCP as a match criteria, select the check box and select a DSCP value keyword
	or enter a DSCP.
	Select from List
	Select from a list of DSCP types.
	Match to Value
	Enter a DSCP Value to match $(0 - 63)$.
IPv4 and IPv6 Class I	Иарѕ
Source Port	Select this field to include a source port in the match condition for the rule. The source port
	is identified in the datagram header.
	Once you select the field, choose the port name or enter the port number.
	Select From List
	Select the keyword associated with the source port to match:
	•) ftp
	•) ftpdata
	•) http
	•) smtp
	•) snmp
	•) teinet
	•) titp
	•) WWW
	Each of these keywords translates into its equivalent port number.
	Match to Port
	The port range is $0 = 65535$ and includes three different types of ports:
	•) $\Omega = 1023$: Well Known Ports
) 1024 – 49151: Registered Ports
	•) 49152 – 65535: Dynamic and/or Private Ports
Destination Port	Select this field to include a destination port in the match condition for the rule. The
Destination Fort	destination port is identified in the datagram header
	Once you select the field, choose the port name or enter the port number.
	Select From List
	Select the keyword associated with the destination port to match:
	•) ftp
	•) ftpdata
	•) http
	•) smtp
	•) snmp
	•) telnet
	•) tftp
	•) www
	Each of these keywords translates into its equivalent port number.
	Match to Port
	Enter the IANA port number to match to the destination port identified in the datagram
	header. The port range is $0 - 65535$ and includes three different types of ports:
	U = 1023: Well Known Ports A0454, Degistered Parts
	1024 – 49151: Registered Ports 10452 – 65525: Dumentia and/ar Driveta Darta
	•) 49152 – 65535: Dynamic and/or Private Ports

Field	Description			
EtherType	Select the EtherType field to compare the match criteria against the value in the header of an Ethernet frame. Select an EtherType keyword or enter an EtherType value to specify the match criteria.			
	Select one of the following protocol types:			
	•) appletalk			
	•) arp			
	•) ipv4			
	•) ipv6			
	•) ipx •) nethios			
	•) pppoe			
	Match to Value			
	Enter a custom protocol identifier to which packets are matched. The value is a four-digit hexidecimal number in the range of 0600 – FFFF.			
Class of Service	Select the field and enter a class of service 802.1p user priority value to be matched for the packets. The valid range is $0 - 7$.			
Source MAC Address	Select this field and enter the source MAC address to compare against an Ethernet frame.			
Source MAC Mask	Enter the source MAC address mask specifying which bits in the destination MAC to compare against an Ethernet frame.			
	An <i>f</i> indicates that the address bit is significant, and a 0 indicates that the address bit is to be ignored. A MAC mask of <i>ff:ff:ff:ff:ff:ff</i> matches a single MAC address.			
Destination MAC Address	Select this field and enter the destination MAC address to compare against an Ethernet frame.			
Destination MAC Mask	Enter the destination MAC address mask specifying which bits in the destination MAC to compare against an Ethernet frame. An <i>f</i> indicates that the address bit is significant, and a 0 indicates that the address bit is to be ignored. A MAC mask of <i>ff:ff:ff:ff:ff:ff:ff</i> matches a single MAC address.			
VLAN ID	Select the field and enter a VLAN ID to be matched for packets. The VLAN ID range is 0 – 4095.			
IPv4 Class Maps				
Service Type	You can specify one type of service to use in matching packets to class criteria.			
IP DSCP	To use IP DSCP as a match criteria, select the check box and select a DSCP value keyword or enter a DSCP. Select from List Select from a list of DSCP types. Match to Value Enter a DSCP Value to match (0 – 63).			
IP Precedence	Select this field to match the packet's IP Precedence value to the class criteria IP Precedence value.			
	The IP Precedence range is 0 – 7.			
IP TOS Bits	Select this field and enter a value to use the packet's Type of Service bits in the IP header as match criteria. The TOS bit value ranges between (00 – FF). The high-order three bits represent the IP precedence value. The high-order six bits represent the IP Differentiated Services Code Point (DSCP) value.			
IP TOS Mask	Enter an IP TOS mask value to perform a boolean AND with the TOS field in the header of the packet and compared against the TOS entered for this rule. The TOS Mask can be used to compare specific bits (Precedence/Type of Service) from the TOS field in the IP header of a packet against the TOS value entered for this rule. (00 – FF).			
Delete Class Map	Check to delete the class map selected in the Class Map Name menu. The class map cannot be deleted if it is already attached to a policy.			

Table 59 - DiffServ Class Map

To delete a Class Map, select the Delete Class Map option and click Apply.

Creating a DiffServ Policy Map

Use the **Policy Map** page to create DiffServ policies and to associate a collection of classes with one or more policy statements.

The UAP supports up to 50 Policy Maps.

Packets are classified and processed based on defined criteria. The classification criteria is defined by a class on the **Class Map** page. The processing is defined by a policy's attributes on the **Policy Map** page. Policy attributes may be defined on a per-class instance basis, and it is these attributes that are applied when a match occurs. A Policy Map can contain up to 10 Class Maps. When the policy is active, the actions taken depend on which class matches the packet.

Packet processing begins by testing the class match criteria for a packet. A policy is applied to a packet when a class match within that policy is found.

To create a DiffServ policy, click the **Policy Map** tab.

Configure Client QoS DiffServ Policy Map Settings				
Policy Map Configuration				
Policy Map Name		(1 - 31 alphanumeric characters)		
Add Policy Map				_
Policy Class Definition				-
Policy Map Name	policy1 -			
Class Map Name	class1 ×

Figure 67 - Configure Client QoS DiffServ Policy Map Settings

Field	Description
Policy Map Name	Enter then name of the policy map to add. The name can contain up to 31 alphanumeric characters.
Policy Map Name (Policy Class Definition)	Select the policy to associate with a member class.
Class Map Name (Policy Class Definition)	Select the member class to associate with this policy name.
Police Simple	Select this option to establish the traffic policing style for the class. The simple form of the policing style uses a single data rate and burst size, resulting in two outcomes: conform and non-conform. Committed Rate Enter the committed rate, in Kbps, to which traffic must conform. Committed Burst Enter the committed burst size, in bytes, to which traffic must conform.
Send	Select Send to specify that all packets for the associated traffic stream are to be forwarded if the class map criteria is met.

Field	Description	
Drop	Select Drop to specify that all packets for the associated traffic stream are to be dropped if the class map criteria is met.	
Mark Class of Service	Select this field to mark all packets for the associated traffic stream with the specified class of service value in the priority field of the 802.1p header. If the packet does not already contain this header, one is inserted. The CoS value is an integer from $0 - 7$.	
Mark IP DSCP	Select this field to mark all packets for the associated traffic stream with the IP DSCP value you select from the list or specify. Select from List Select from a list of DSCP types. Match to Value Enter a DSCP Value to match (0 – 63).	
Mark IP Precedence	Select this field to mark all packets for the associated traffic stream with the specified IP Precedence value. The IP Precedence value is an integer from $0 - 7$.	
Disassociate Class Map	Select this option and click Apply to remove the class selected in the Class Map Name menu from the policy selected in the Policy Map Name menu.	
Member Classes	Lists all DiffServ classes currently defined as members of the selected policy. If no class is associated with the policy, the field is empty.	
Delete Policy Map	Select this field to delete the policy map showing in the Policy Map Name menu.	

Table 60 - DiffServ Policy Map

To delete a Policy Map, select the **Delete Policy Map** option and click **Apply**.

Client QoS Status

The **Client QoS Status** page shows the client QoS settings that are applied to each client currently associated with the AP.

To view QoS settings for an associated client, click the Client QoS Status tab.

QOS Configuration Status for associated clients			
Station 00:0c:43:30:60:00 -			
Glabal OoS Mode	down		
Client QoS Mode	Disabled		
Bandwidth Limit Up	0		
Bandwidth Limit Down	0		
ACL Type Up	None		
ACL Name Up			
ACL Type Down	None		
ACL Name Down			
DiffServ Policy Up			
DiffServ Policy Down			

Figure 68 - QoS Configuration Status For Associated Clients

Field	Description
Station	The Station menu contains the MAC address of each client currently associated with the AP. To view the QoS settings applied to a client, select its MAC address from the list.
Global QoS Mode	Shows the current Client QoS Global Admin Mode on the AP.
Client QoS Mode	Shows whether the QOS mode for the selected client is enabled or disabled . Note: For the Qos Mode to be enabled on a client, it must be globally enabled on the AP and enabled on the VAP the client is associated with. Use the VAP QoS Parameters page to enable the QoS Global Admin mode and the per-VAP QoS Mode.
Bandwidth Limit Up	Shows the maximum allowed transmission rate from the client to the AP in bits per second (bps). The valid range is $0 - 4294967295$ bps.
Bandwidth Limit Down	Shows the maximum allowed transmission rate from the AP to the client in bits per second (bps). The valid range is $0 - 4294967295$ bps.

Field	Description
АСL Туре Up	 Shows the type of ACL that is applied to traffic in the inbound (client-to-AP) direction, which can be one of the following:) IPv4: The ACL examines IPv4 packets for matches to ACL rules.) IPv6: The ACL examines IPv6 packets for matches to ACL rules.) MAC: The ACL examines layer 2 frames for matches to ACL rules.
ACL Name Up	Shows the name of the ACL applied to traffic entering the AP in the inbound direction. When a packet or frame is received by the AP, the ACL's rules are checked for a match. The packet or frame is processed if it is permitted and discarded if it is denied.
ACL Type Down	 Shows the type of ACL to apply to traffic in the outbound (AP-to-client) direction, which can be one of the following: IPv4: The ACL examines IPv4 packets for matches to ACL rules. IPv6: The ACL examines IPv6 packets for matches to ACL rules. MAC: The ACL examines layer 2 frames for matches to ACL rules
ACL Name Down	Shows the name of the ACL applied to traffic in the outbound direction. After switching the packet or frame to the outbound interface, the ACL's rules are checked for a match. The packet or frame is transmitted if it is permitted and discarded if it is denied.
DiffServ Policy Up	Shows the name of the DiffServ policy applied to traffic sent to the AP in the inbound (client- to-AP) direction.
DiffServ Policy Down	Shows the name of the DiffServ policy applied to traffic from the AP in the outbound (AP-to- client) direction.

Table 61 - Client QoS Status

Configuring RADIUS-Assigned Client QoS Parameters

If a VAP is configured to use WPA Enterprise security, you can include client QoS information in the client database on the RADIUS server. When a client successfully authenticates, the RADIUS server can include bandwidth limits and identify the ACLs and DiffServ policies to apply to the specific wireless client. ACLs and DiffServ policies referenced in the RADIUS client database must match the names of the ACLs and DiffServ policies configured on the AP to be successfully applied to the wireless clients.

The following table describes the QoS attributes that can be included in the client's RADIUS server entry. If a wireless client successfully authenticates using WPA Enterprise, each QoS RADIUS attribute that exists for the client is sent to the AP for processing. The attributes are optional and do not need to be present in the client entry. If the attribute is not present, the Client QoS setting on the AP is used.

RADIUS Attribute	ID	Description	Type/Range
Vendor-Specific (26), WISPr-Bandwidth- Max-Down	14122,8	Maximum allowed client reception rate from the AP in bits per second. If nonzero, the specified value is rounded down to the nearest 64 Kbps value when used in the AP (64 Kbps minimum). If zero, bandwidth limiting is not enforced for the client in this direction.	Type: integer 32-bit unsigned integer value (0- 4294967295)
Vendor-Specific (26), WISPr-Bandwidth- Max-Up	14122,7	Maximum allowed client transmission rate to the AP in bits per second. If nonzero, the specified value is rounded down to the nearest 64 Kbps value when used in the AP (64 Kbps minimum). If zero, bandwidth limiting is not enforced for the client in this direction.	Type: integer 32-bit unsigned integer value (0- 4294967295)
Vendor-Specific (26), LVL7-Wireless-Client- ACL-Dn	6132,120	Access list identifier to be applied to 802.1X authenticated wireless client traffic in the outbound (down) direction. If this attribute refers to an ACL that does not exist on the AP, all packets for this client will be dropped until the ACL is defined.	Type: string 5-36 characters (not null-terminated) The string is of the form "type:name" where: type = ACL type identifier: IPV4, IPV6, MAC : = required separator character name = 1-31 alphanumeric characters, specifying the ACL number (IPV4) or name (IPV6, MAC)

RADIUS Attribute	ID	Description	Type/Range
Vendor-Specific (26), LVL7-Wireless-Client- ACL-Up	6132,121	Access list identifier to be applied to 802.1X authenticated wireless client traffic in the inbound (up) direction. If this attribute refers to an ACL that does not exist on the AP, all packets for this client will be dropped until the ACL is defined.	Type: string 5-36 characters (not null-terminated) The string is of the form "type:name" where: type = ACL type identifier: IPV4, IPV6, MAC : = required separator character name = 1-31 alphanumeric characters, specifying the ACL number (IPV4) or name (IPV6, MAC)
Vendor-Specific (26), LVL7-Wireless-Client- Policy-Dn	6132,122	Name of DiffServ policy to be applied to 802.1X authenticated wireless client traffic in the outbound (down) direction. If this attribute refers to a policy name that does not exist on the AP, all packets for this client will be dropped until the DiffServ policy is defined.	Type: string 1-31 characters (not null-terminated)
Vendor-Specific (26), LVL7-Wireless-Client- Policy-Up	6132,123	Name of DiffServ policy to be applied to 802.1X authenticated wireless client traffic in the inbound (up) direction. If this attribute refers to a policy name that does not exist on the AP, all packets for this client will be dropped until the DiffServ policy is defined.	Type: string 1-31 characters (not null-terminated)

Table 62 - Client QoS RADIUS Attributes
Section 9 - Clustering Multiple APs

The UAP supports AP clusters. A cluster provides a single point of administration and lets you view, deploy, configure, and secure the wireless network as a single entity rather than a series of separate wireless devices.

This section describes the following features:

- •) "Managing Cluster Access Points in the Cluster" on page 109
- •) "Managing Cluster Sessions" on page 113
- •) "Configuring and Viewing Channel Management Settings" on page 114
- •) "Viewing Wireless Neighbourhood Information" on page 116
- •) "Cluster Firmware Upgrade" on page 119

Managing Cluster Access Points in the Cluster

The AP cluster is a dynamic, configuration-aware group of APs in the same subnet of a network. Each cluster can have up to **8 members**. Only one cluster per wireless network is supported; however, a network subnet can have multiple clusters. Clusters can share various configuration information, such as VAP settings and QoS queue parameters.

A cluster can be formed between two APs if the following conditions are met:

- •) The APs are identical models.
- •) The APs are connected on the same bridged segment.
- •) The APs joining the cluster have the same Cluster Name.
- •) Clustering mode is enabled on both APs.

Note: For two APs to be in the same cluster, they do not need to have the same number of radios; however, the supported capabilities of the radios should be same. **Note:** DWL-6700AP doesn't support clustering.

Clustering APs

Only identical models may be clustered together. For example, the DWL-2600AP can only form a cluster with other DWL-2600APs.

Viewing and Configuring Cluster Members

The **Access Points** page allows you to start or stop clustering on an AP, view the cluster members, and configure the location and cluster name for a cluster member. From the **Access Points** page, you can also click the IP address of each cluster member to navigate to configuration settings and data on an access point in the cluster.

To view information about cluster members and to configure the location and cluster of an individual member, click the **Access Points** tab.

The following figure shows the **Cluster > Access Points** page when clustering is not enabled.

Manage access points in the cluster	
This access point is operating in stand-alone mode This access point is operating in stand-alone mode, and is not managed as part of a cluster. You can choose to manage this access point as part of a cluster. To do this, press the "start clustering" button below. Start Clustering	Not Clustered
Clustering Options	
Enter the location of this AP,	
Location: A423	
Enter the name of the cluster for this AP to join.	
Cluster Name: Cluster1	
Clustering IP Version: 💬 IPv6 🕘 IPv4	
Click "Apply" to save the new settings. Apply	

Figure 69 - Manage Access Points In The Cluster (Passive)

The following figure shows the **Cluster > Access Points** page when clustering is enabled and two access points are in the cluster.

Manage access points in the cluster	
Access Points	Clustered
Status: Clustering is online	
Location MAC Address IP Address	
A423 00:05:5E:80:70:00 10.90.90.91	Points
A424 00:90:4C:01:6D:6C 10.90.90.92	
Stop Clustering	
Clustering Options	
Location: A423	
Cluster Name: Cluster 1	
Clustering IP Version: O IPv6 @ IPv4	

Figure 70 - Manage Access Points In The Cluster (Active)

If clustering is currently disabled on the AP, the **Start Clustering** button is visible. If clustering is enabled, the **Stop Clustering** button is visible. You can edit the clustering option information when clustering is disabled.

The following table describes the configuration and status information available on the cluster Access Points page.

Field	Description
Status	If the status field is visible, then the AP is enabled for clustering. If clustering is not enabled, then the AP is operating in stand-alone mode and none of the information in this table is visible. To disable clustering on the AP, click Stop Clustering .
Location	Description of where the access point is physically located.
MAC Address	Media Access Control (MAC) address of the access point. The address shown here is the MAC address for the bridge (br0). This is the address by which the AP is known externally to other networks.
IP Address	Specifies the IP address for the access point. Each IP address is a link to the Administration Web pages for that access point. You can use the links to navigate to the Administration Web pages for a specific access point. This is useful for viewing data on a specific access point to make sure a cluster member is picking up cluster configuration changes, to configure advanced settings on a particular access point, or to switch a standalone access point to cluster mode.
Cluster-Priority	This is supported only for IPv4. It specifies the Priority of the member access point and is configurable by user. The higher number indicates the higher preference for this AP to become the dominant AP. In case of tie, lowest MAC address becomes dominant. Range: 0 to 255. Default value is 0. Note: Currently, this field is available only in DWL-3610AP and DWL-6610B1AP.

Field	Description
Cluster-Controller	This is supported only for IPv4. It specifies which member access point is "Dominant".
	"no" in the table.
	Note: Currently, this field is available only in DWL-3610AP and DWL-6610B1AP.

Table 63 - Access Points in the Cluster

Cluster Options

The following table describes the cluster information to configure for an individual member. The clustering options are read-only when clustering is enabled. To configure the clustering options, you must stop clustering.

Field	Description
Location	Enter a description of where the access point is physically located.
Cluster Name	Enter the name of the cluster for the AP to join. The cluster name is not sent to other APs in the cluster. You must configure the same cluster name on each AP that is a member of the cluster. The cluster name must be unique for each cluster you configure on the network.
Clustering IP Version	Specify the IP version that the APs in the cluster use to communicate with each other.
Cluster-Priority	This is supported only for IPv4. Specifies the Priority of the cluster member and is configurable by user. The higher number indicates the higher preference for this AP to become the dominant AP. In case of tie, lowest MAC address becomes dominant. Range: 0 to 255. Default value is 0. Note: Currently, this field is available only in DWL-3610AP and DWL-6610B1AP.

Table 64 - Cluster Options

Single IP Management

The following table describes to configure **Single IP Management**.

Field	Description
Cluster	This is supported only for IPv4. In order to access the cluster with a single IP, the cluster can
Management	be configured with an option of Cluster IP address. This is a part of the global configuration
Address	of the cluster in section. It has to be statically configured by the Cluster Administrator. The
	Cluster IP management address should be part of the same subnet as the clustered AP
	management IP addresses. The Cluster IP address is configured as secondary IP address
	to the management interface of the Dominant AP. The Dominant AP user interface is
	accessible using the Cluster IP address. When the Cluster IP address is set as secondary
	IP address on the Dominant AP, it sends Gratuitous ARPs on the management VLAN so that
	the mapping between the new IP address and the Mac-address is established in the subnet.
	The Cluster IP address configuration is shared among all the clustered APs.

Table 65 - Single IP Management Options

Secure Join Clustering

The following table describes to configure Secure Join Clustering. This is supported only for IPv4.

Field	Description
Secure Mode	Configuration parameter to enable/disable Secure Join Clustering. When enabled only members with same pass-phrase will form the cluster. Default value id Disable.

Field	Description
Pass Phrase	Passphrase must be configured for the secure mode to be effective. Passphrase must be at least 8 characters to a maximum of 63 characters. Acceptable characters include upper and lower case alphabetic letters, the numeric digits, and special symbols such as @ and #. Leading and trailing spaces are not allowed.
Reauthentication Timeout	This timeout verifies the authenticity of the cluster members with higher IP address at regular intervals. Default value is 300 seconds.

Table 66 - Secure Join Clustering

Note: Currently, Single IP Management and Secure Join Clustering features are available only in DWL-3610AP and DWL-6610B1AP.

Removing an Access Point from the Cluster

To remove an access point from the cluster, do the following.

- Go to the Administration Web pages for the clustered access point. The Administration Web pages for the standalone access point are displayed.
- 2.) Click the **Cluster > Access Points** link in the Administration pages.
- 3.) Click Stop Clustering.
- 4.) The change will be reflected under Status for that access point; the access point will now show as stand-alone (instead of cluster).

Adding an Access Point to a Cluster

To add an access point that is currently in standalone mode back into a cluster, do the following.

- 1.) Go to the Administration Web pages for the standalone access point.
- 2.) Click the **Cluster > Access Points** link in the Administration pages for the stand-alone access point. The **Access Points** page for a standalone access point indicates that the current mode is standalone.
- 3.) Type the name or location of the AP in the **Location** field to identify the AP within the cluster.
- 4.) Type the name of the cluster for the AP to join in the **Cluster Name** field.
- 5.) Click Start Clustering.
- 6.) The access point is now a cluster member. Its Status (Mode) on the **Cluster > Access Points** page now indicates Cluster instead of Not Clustered.

Navigating to Configuration Information for a Specific AP

In general, the UAP is designed for central management of *clustered* access points. For access points in a cluster, all access points in the cluster reflect the same configuration. In this case, it does not matter which access point you actually connect to for administration.

There may be situations, however, when you want to view or manage information on a particular access point. For example, you might want to check status information such as client associations or events for an access point. In this case, you can navigate to the Administration Web interface for individual access points by clicking the IP address links on the **Access Points** page.

All clustered access points are shown on the **Cluster > Access Points** page. To navigate to clustered access points, you can simply click on the IP address for a specific cluster member shown in the list.

Navigating to an AP by Using its IP Address in a URL

You can also link to the Administration Web pages of a specific access point, by entering the IP address for that

access point as a URL directly into a Web browser address bar in the following form: http://IPAddressOfAccessPoint

where *IPAddressOfAccessPoint* is the address of the particular access point you want to monitor or configure.

Managing Cluster Sessions

The **Sessions** page shows information about client stations associated with access points in the cluster. Each client is identified by its MAC address, along with the AP (location) to which it is currently connected.

To view a particular statistic for client sessions, select an item from the Display drop-down list and click **Go**. You can view information about idle time, data rate, signal strength and so on; all of which are described in detail in the table below.

A session in this context is the period of time in which a user on a client device (station) with a unique MAC address maintains a connection with the wireless network. The session begins when the client logs on to the network, and the session ends when the client either logs off intentionally or loses the connection for some other reason.

Note: A session is not the same as an association, which describes a client connection to a particular access point. A client network connection can shift from one clustered AP to another within the context of the same session. A client station can roam between APs and maintain the session.

To manage sessions associated with the cluster, click **Cluster > Sessions**.

Manage sessions associated with the cluster	
Sessions	
You may sort the following table by clicking on any of the column names.	
Display Ali	
AP Location User MAC Idle Rate (Mbps) Signal Rx Total Tx Total Error Rate	
A423 00:0C:43:30:60:00 0 65 64 190 69 0	
You may restrict the number of columns displayed by selecting a field other than "all" in the choice box above. By selecting a specific field, the table will show only "User" the selected field for each session. Click the "Go" button to apply the new selection.	", "AP Location", "User MAC" and

Figure 71 - Manage Sessions Associated With The Cluster

Field Description **AP** Location Indicates the location of the access point. This is derived from the location description specified on the **Basic Settings** page. **User MAC** Indicates the MAC address of the wireless client device. A MAC address is a hardware address that uniquely identifies each node of a network. Idle Indicates the amount of time this station has remained inactive. A station is considered to be idle when it is not receiving or transmitting data. Rate The speed at which this access point is transferring data to the specified client. The data transmission rate is measured in megabits per second (Mbps). This value should fall within the range of the advertised rate set for the mode in use on the access point. For example, 6 to 54 Mbps for 802.11a. Indicates the strength of the radio frequency (RF) signal the client receives from the access Signal point. The measure used for this is a value known as Received Signal Strength Indication (RSSI), and will be a value between 0 and 100. RSSI is determined by a mechanism implemented on the network interface card (NIC) of the client station. **Receive Total** Indicates number of total packets received by the client during the current session. **Transmit Total** Indicates number of total packets transmitted to the client during this session. **Error Rate** Indicates the percentage of time frames are dropped during transmission on this access point.

Details about the session information shown is described in the following table.

Table 67 - Session Management

Sorting Session Information

To sort the information shown in the tables by a particular indicator, click the column label by which you want to order things. For example, if you want to see the table rows ordered by signal strength, click the **Signal** column label. The entries will be sorted by signal strength.

Channel Session supports **Clustering Options**, **Single IP Management**, and **Secure Join Clustering**. For more details, please refer to the following sections: "Cluster Options" on page 111, "Single IP Management" on page 111, and "Secure Join Clustering" on page 111.

Note: Currently, Clustering Options, Single IP Management, and Secure Join Clustering features are available only in DWL-3610AP and DWL-6610B1AP.

Configuring and Viewing Channel Management Settings

When Channel Management is enabled, the UAP automatically assigns radio channels used by clustered access points. The automatic channel assignment reduces mutual interference (or interference with other access points outside of its cluster) and maximizes Wi-Fi bandwidth to help maintain the efficiency of communication over the wireless network.

You must start channel management to get automatic channel assignments; it is disabled by default on a new AP.

At a specified interval, the Channel Manager maps APs to channel use and measures interference levels in the cluster. If significant channel interference is detected, the Channel Manager automatically re-assigns some or all of the APs to new channels per an efficiency algorithm (or *automated channel plan*). If the Channel Manager determines that a change is necessary, that information is sent to all members of the cluster and a syslog message is generated indicating the sender AP, new and old channel assignments.

The Channel Management page shows previous, current, and planned channel assignments for clustered access points. By default, automatic channel assignment is disabled. You can start channel management to optimize channel usage across the cluster on a scheduled interval.

To configure and view the channel assignments for the cluster members, click the **Channel Management** tab.

Automatically manage channel assignments		
Channels	Clustered Clustered	
Stop automatically re-assigning channels	2

Determine if there is better set of channel settings every 1	Hour	
	Apply	

Figure 72 - Automatically Manage Channel Assignments

From this page, you can view channel assignments for all APs in the cluster and stop or start automatic channel management. By using the Advanced settings on the page, you can modify the interference reduction potential that triggers channel re-assignment, change the schedule for automatic updates, and re-configure the channel set used for assignments.

Stopping/Starting Automatic Channel Assignment

By default, automatic channel assignment is disabled (off).

Note: Channel Management overrides the default cluster behavior, which is to synchronize radio channels of all APs across a cluster. When Channel Management is enabled, the radio Channel is not synced across the cluster to other APs.

- Click Start to resume automatic channel assignment. When automatic channel assignment is enabled, the Channel Manager periodically maps radio channels used by clustered access points and, if necessary, re-assigns channels on clustered APs to reduce interference (with cluster members or other APs outside the cluster).
- •) Click **Stop** to stop automatic channel assignment. (No channel usage maps or channel re-assignments will be made. Only manual updates will affect the channel assignment.)

Viewing Current Channel Assignments and Setting Locks

The *Current Channel Assignments* section shows a list of all access points in the cluster by IP Address. The display shows the band on which each AP is broadcasting (a/b/g/n), the current channel used by each AP, and an option to lock an AP on its current radio channel so that it cannot be re-assigned to another.

The following table provides details about Current Channel Assignments.

Field	Description
IP Address	Specifies the IP Address for the access point.
Radio	Identifies the MAC address of the radio.
Band	Indicates the band on which the access point is broadcasting.
Current	Indicates the radio Channel on which this access point is currently broadcasting.
Status	Shows whether the radio is up (on) or down (off).
Locked	Click Locked to force the access point to remain on the current channel. When Locked is selected (enabled) for an access point, automated channel management plans will not re-assign the AP to a different channel as a part of the optimization strategy. Instead, APs with locked channels will be factored in as requirements for the plan. If you click Apply , you will see that locked APs show the same channel for the Current Channel and Proposed Channel fields. Locked APs will keep their current channels.

Table 68 - Channel Assignments

Viewing the Last Proposed Set of Changes

The *Proposed Channel Assignments* shows the last channel plan. The plan lists all access points in the cluster by IP Address, and shows the current and proposed channels for each AP. Locked channels will not be re-assigned and the optimization of channel distribution among APs will take into account the fact that locked APs must remain on their current channels. APs that are not locked may be assigned to different channels than they were previously using, depending on the results of the plan.

Field	Description
IP Address	Specifies the IP Address for the access point.
Radio	Indicates the radio channel on which this access point is currently broadcasting.
Proposed Channel	Indicates the radio channel to which this access point would be re-assigned if the Channel Plan is executed.

Table 69 - Last Proposed Changes

Configuring Advanced Settings

The advanced settings allow you to customize and schedule the channel plan for the cluster. If you use Channel Management as provided (without updating Advanced Settings), channels are automatically fine-tuned once every hour if interference can be reduced by 25 percent or more. Channels will be re-assigned even if the network is busy. The appropriate channel sets will be used (b/g for APs using IEEE 802.11b/g and a for APs using IEEE 802.11a).

The default settings are designed to satisfy most scenarios where you would need to implement channel management.

Use **Advanced Settings** to modify the interference reduction potential that triggers channel re-assignment, change the schedule for automatic updates, and re-configure the channel set used for assignments. If there are no fields showing in the Advanced section, click the toggle button to display the settings that modify timing and details of the channel planning algorithm.

Field	Description
Change channels if interference is reduced by at least	Specify the minimum percentage of interference reduction a proposed plan must achieve in order to be applied. The default is 75 percent. Use the drop-down menu to choose percentages ranging from 5 percent to 75 percent. This setting lets you set a gating factor for channel re-assignment so that the network is not continually disrupted for minimal gains in efficiency. For example, if channel interference must be reduced by 75 percent and the proposed channel assignments will only reduce interference by 30 percent, then channels will not be re-assigned. However; if you re-set the minimal channel interference benefit to 25 percent and click Apply , the proposed channel plan will be implemented and channels re-assigned as needed.
Determine if there is better set of channels every	Use the drop-down menu to specify the schedule for automated updates. A range of intervals is provided, from 30 Minutes to 6 Months The default is 1 Hour (channel usage re-assessed and the resulting channel plan applied every hour).

Table 70 - Advanced Channel Management Settings

Click Apply under Advanced settings to apply these settings.

Advanced settings will take effect when they are applied and influence how automatic channel management is performed.

Channel Management supports **Clustering Options**, **Single IP Management**, and **Secure Join Clustering**. For more details, please refer to the following sections: "Cluster Options" on page 111, "Single IP Management" on page 111, and "Secure Join Clustering" on page 111.

Note: Currently, Clustering Options, Single IP Management, and Secure Join Clustering features are available only in DWL-3610AP and DWL-6610B1AP.

Viewing Wireless Neighbourhood Information

The Wireless Neighbourhood shows up to 20 access points per radio within range of every member of the cluster, shows which access points are within range of which cluster members, and distinguishes between cluster members and non-members.

Note: The Wireless Neighbourhood page shows up to 20 access points per radio. To see all the access points detected on a given cluster access point, navigate to that cluster member's web interface and go to the **Status > Neighbouring Access Points** page.

For each neighbour access point, the Wireless Neighbourhood view shows identifying information (SSID or Network Name, IP Address, MAC address) along with radio statistics (signal strength, channel, beacon interval). You can click on an AP to get additional statistics about the APs in radio range of the currently selected AP.

The Wireless Neighbourhood view can help you:

- •) Detect and locate unexpected (or *rogue*) access points in a wireless domain so that you can take action to limit associated risks
- •) Verify coverage expectations. By assessing which APs are visible at what signal strength from other APs, you can verify that the deployment meets your planning goals.
- •) Detect faults. Unexpected changes in the coverage pattern are evident at a glance in the color coded table.

Figure 73 - View Neighboring Access Points

The following table describes details about the Wireless Neighbourhood information.

Field	Description
Display neighbouring APs	 Click one of the following radio buttons to change the view: In cluster — Shows only neighbour APs that are members of the cluster Not in cluster — Shows only neighbour APs that are not cluster members Both — Shows all neighbour APs (cluster members and non-members)
Cluster	The Cluster list at the top of the table shows IP addresses for all access points in the cluster. (This is the same list of cluster members shown on the Cluster > Access Points tab.) If there is only one AP in the cluster, only a single IP address column will be displayed here; indicating that the AP is clustered with itself. You can click on an IP address to view more details on a particular AP.

Field	Description
Neighbours	Access points which are neighbours of one or more of the clustered APs are listed in the left column by SSID (Network Name).
	An access point which is detected as a neighbour of a cluster member can also be a cluster member itself. Neighbours who are also cluster members are always shown at the top of the list with a heavy bar above and include a location indicator.
	The coloured bars to the right of each AP in the Neighbours list shows the signal strength for each of the neighbour APs as detected by the cluster member whose IP address is shown at the top of the column
	The color of the bar indicates the signal strength:
	•) Dark Blue Bar — A dark blue bar and a high signal strength number (for example 50) indicates good signal strength detected from the Neighbour seen by the AP whose IP address is listed above that column.
	•) Lighter Blue Bar — A lighter blue bar and a lower signal strength number (for example 20 or lower) indicates medium or weak signal strength from the Neighbour seen by the AP whose IP address is listed above that column
	•) White Bar — A white bar and the number 0 indicates that a neighbouring AP that was detected by one of the cluster members cannot be detected by the AP whose IP address if listed above that column.
	•) Light Gray Bar — A light gray bar and no signal strength number indicates a Neighbour that is detected by other cluster members but not by the AP whose IP address is listed above that column.
	•) Dark Gray Bar — A dark gray bar and no signal strength number indicates this is the AP whose IP address is listed above that column (since it is not applicable to show how well the AP can detect itself).
	Table 71 - Wireless Neighborhood Information

Viewing Details for a Cluster Member

To view details on a cluster member AP, click on the IP address of a cluster member at the top of the page. The following figure shows the Neighbor Details of the AP with an IP address of 10.90.90.91.

Neighbor Details						
10.90.90.91						
SSID	MAC Address	Channel	Rate	Signal	Beacon Interval	Beacon Age
qqqqq	00:DE:FA:07:24:DD	44	60	8	100	Sat Jan 1 01:21:37 2000
dlink1	B8:A3:86:FE:1C:40	44	60	38	100	Sat Jan 1 01:32:37 2000
Josh_2600_2	00:05:50:11:22:A1	1	10	50	100	Sat Jan 1 00:00:06 2000
Wr1t3r	F0:7D:68:78:92:A2	3	10	100	100	Sat Jan 1 01:31:37 2000

Figure 74 - Viewing Details For A Cluster Member

The following table explains the details shown about the selected AP.

Field	Description
SSID	The Service Set Identifier (SSID) for the access point. The SSID is an alphanumeric string of up to 32 characters that uniquely identifies a wireless local area network. It is also referred to as the <i>Network Name</i> . A Guest network and an Internal network running on the same access point must always have two different network names.
MAC Address	Shows the MAC address of the neighbouring access point. A MAC address is a hardware address that uniquely identifies each node of a network.
Channel	Shows the channel on which the access point is currently broadcasting. The Channel defines the portion of the radio spectrum that the radio uses for transmitting and receiving.
Rate	Shows the rate (in megabits per second) at which this access point is currently transmitting. The current rate will always be one of the rates shown in Supported Rates.
Signal	Indicates the strength of the radio signal emitting from this access point as measured in decibels (Db).

Field	Description
Beacon Interval	Shows the Beacon interval being used by this access point. Beacon frames are transmitted by an access point at regular intervals to announce the existence of the wireless network. The default behavior is to send a beacon frame once every 100 milliseconds (or 10 per second).
Beacon Age	Shows the date and time of the last beacon received from this access point.

Table 72 - Cluster Member Details

Wireless Neighbourhood supports **Clustering Options**, **Single IP Management**, and **Secure Join Clustering**. For more details, please refer to following sections: "Cluster Options" on page 111, "Single IP Management" on page 111, and "Secure Join Clustering" on page 111.

Note: Currently, Clustering Options, Single IP Management, and Secure Join Clustering features are available only in DWL-3610AP and DWL-6610B1AP.

Cluster Firmware Upgrade

Cluster provides a centralized cluster firmware upgrade feature that allows all the APs in the cluster to be upgraded from the dominant AP. The Cluster firmware upgrade can be performed only from the dominant AP. For each member access point, the cluster firmware upgrade page shows identifying information (All members checkbox or selective members checkbox, IP Address, Firmware Version and Firmware transfer status).

Viewing Details for a Cluster Firmware Upgrade

The following table explains the details shown about the selected AP and other fields of Cluster Firmware upgrade page.

Field	Description
Members	The Members field displays (cluster member) access points. The total supported cluster members are 10.
IP Address	Shows the IP address of the member access points.
MAC Address	Shows the MAC address of the member access points.
Firmware Version	Shows current running firmware version of the cluster member.
Firmware-transfer- status	Shows whether the firmware download and validation in cluster member is successful or failure. It displays any of the following statuses: None/Started/Donwloaded/Success/Fail/Abort_admin/Abort_local/Dap_resigned.
Firmware-transfer- progress-bar	Shows the progress bar for firmware download. This field will be displayed only when firmware download is in progress to non-dominant members.
Upload Method	Administrator planning to use centralized cluster firmware must provide a TFTP or HTTP/ HTTPS mechanism for Dominant AP to download the AP image. The image is downloaded and stored in the ram disk (/tmp) of the dominant AP as a file
New Firmware Image	Show the New Firmware Image selected.
OverAll Upgrade Status	Shows the Overall upgrade status (In_progress/Completed/Fail/Abort_admin/None).
Start-Upgrade	Starts the image upgrade of all members or selectively.
Stop	Stop the Image upgrade of all members or selected members.

Table 73 - Cluster Firmware Upgrade

Cluster Firmware Upgrade supports **Clustering Options**, **Single IP Management**, and **Secure Join Clustering**. For more details, please refer to following sections: "Cluster Options" on page 111, "Single IP Management" on page 111, and "Secure Join Clustering" on page 111.

Note: Currently, Single IP Management and Secure Join Clustering features are available only in DWL-3610AP and DWL-6610B1AP.

Appendix A - Default AP Settings

When you first power on a UAP, it has the default settings shown in the following table.

Feature	Default
System Information	
User Name	admin
Password	admin
Ethernet Interface Settings	
Connection Type	DHCP
DHCP	Enabled
IP Address	10.90.90.91 (if no DHCP server is available)
Subnet Mask	255.0.0.0
DNS Name	None
Management VLAN ID	1
Untagged VLAN ID	1
IPv6 Admin Mode	Enabled
IPv6 Auto Config Admin Mode	Enabled
Radio Settings	
Radio (1 and 2)	One
Radio 1 IEEE 802.11 Mode	802.11a/n
Radio 2 IEEE 802.11 Mode	802.11b/g/n
802.11a/n Channel	Auto
802.11b/g/n Channel	Auto
Radio 1 Channel Bandwidth	40 MHz
Radio 2 Channel Bandwidth	20 MHz
Primary Channel	Lower
Short Guard Interval Supported	Yes
STBC Mode	On
Protection	Auto
Maximum Wireless Clients	200
Transmit Power	100 percent
Legacy Rate Sets Supported (Mbps)	IEEE 802.11a: 54, 48, 36, 24, 18, 12, 9, 6 IEEE 802.11b: 11, 5.5, 2, 1 IEEE 802.11g: 54, 48, 36, 24, 18, 12, 11, 9, 6, 5.5, 2, 1
Legacy Rate Sets (Mbps) (Basic/Advertised)	IEEE 802.11a: 24, 12, 6 IEEE 802.11b: 2, 1 IEEE 802.11g: 11, 5.5, 2, 1
MCS (Data Rate) Settings (802.11n only)	0–15 Enabled
Broadcast/Multicast Rate Limiting	Disabled
Fixed Multicast Rate	Auto
Beacon Interval	100
DTIM Period	2
Fragmentation Threshold	2346
RTS Threshold	2347
TSPEC Mode	Off
TSPEC Voice ACM Mode	Off
Virtual Access Point Settings	
Status	VAP0 is enabled on both radios, all other VAPs disabled

D-Link October 2016

Feature	Default
VLAN ID	1
Network Name (SSID)	dlink1 through dlink16
Broadcast SSID	Allow
Security Mode	None (plain text)
MAC Authentication Type	None
RADIUS IP Address	10.90.90.1
RADIUS Key	secret
RADIUS Accounting	Disabled
Redirect Mode	None
Other Default Settings	
WDS Settings	None
STP	Disabled
MAC Authentication	No stations in list
Load Balancing	Disabled
SNMP	Enabled
RO SNMP Community Name	public
SNMP Agent Port	161
SNMP Set Requests	Enabled
Managed AP Mode	Enabled
Authentication (802.1X Supplicant)	Disabled
Management ACL	Disabled
HTTP Access	Enabled; disabled in Managed Mode
HTTPS Access	Enabled; disabled in Managed Mode
Console Port Access	Enabled
Telnet Access	Enabled; disabled in Managed Mode
SSH Access	Enabled; disabled in Managed Mode
WMM	Enabled
Email Alert Admin Mode	Down
Time	Manual (Not set)
Client QoS Global Admin Mode	Disabled
Per-VAP Client QoS Mode	Disabled
Clustering	Stopped

Table 74 - UAP Default Settings

Appendix B - Configuration Examples

This appendix contains examples of how to configure selected features available on the UAP. Each example contains procedures on how to configure the feature by using the Web interface, CLI, and SNMP.

This appendix describes how to perform the following procedures:

- •) "Configuring a VAP" on page 122
- •) "Configuring Radio Settings" on page 124
- •) "Configuring the Wireless Distribution System" on page 125
- •) "Clustering Access Points" on page 126
- •) "Configuring Client QoS" on page 128

For all SNMP examples, the objects you use to AP are in a private MIB. Take DWL-6600AP for example, the path to the tables that contain the objects is iso(1).org(3).dod(6).internet(1).private(4).enterprises(1).dlink(171).dlink-products(10).dwl-6600AP(1)28).dwl6600AP(1).dwl_6600AP(1).dwlWLANAPNewMibs(26).

DWL-8710AP: 1.3.6.1.4.1.171.10.149.1.1.26 DWL-8610AP: 1.3.6.1.4.1.171.10.136.1.1.26 DWL-6610AP: 1.3.6.1.4.1.171.10.143.1.1.26 DWL-6610B1: 1.3.6.1.4.1.171.10.152.1.1.26 DWL-3610AP: 1.3.6.1.4.1.171.10.151.1.1.26 DWL-8600AP: 1.3.6.1.4.1.171.10.37.29.1.26 DWL-6700AP: 1.3.6.1.4.1.171.10.142.1.1.26 DWL-6600AP: 1.3.6.1.4.1.171.10.128.1.1.26 DWL-3600AP: 1.3.6.1.4.1.171.10.129.1.1.26 DWL-2600AP: 1.3.6.1.4.1.171.10.130.1.1.26

Configuring a VAP

This example shows how to configure VAP 1 with the following non-default settings:

- •) VLAN ID: 2
- •) SSID: Marketing
- •) Security: WPA Personal using WPA2 with CCMP (AES)

VAP Configuration from the Web Interface

1.) Log onto the AP and navigate to the Manage > VAP page.

/AP	Enabled	VLAN II	D SSID	Broadcast SS	ID Security		MAC Auth T	Гуре	Redirect	Mode	Redirect URL	
)		1	dlink1	V	None	-	Disabled	•	None •			
L	V	2	Marketing		WPA Personal	•	Disabled	•	None •			
					WPAVersions: Cipher Suites:			WPA TKJP		V WPA2 CCMP (AES)		
					Key:			•••••	•••••			
					Broadcast Key	Refresh Rate	e (Range: 0-86400)	300				

Figure 75 - VAP Configuration from the Web Interface

- 2.) In the Enabled column for VAP 1, select the check box.
- 3.) Enter 2 in the VLAN ID column.
- 4.) In the **SSID** column, delete the existing SSID and type *Marketing*.
- 5.) Select WPA Personal from the menu in the Security column. Additional fields appear.
- 6.) Select the WPA2 and CCMP (AES) options, and clear the WPA and TKIP options.
- 7.) Enter a WPA encryption key in the **Key** field. The key can be a mix of alphanumeric and special characters. The key is case sensitive and can be between 8 and 63 characters.
- 8.) Click Apply to update the AP with the new settings.

VAP Configuration from the CLI

- 1.) Connect to the AP by using Telnet, SSH, or a serial connection.
- 2.) Enable VAP 1.

set vap vap1 status up

3.) Set the VLAN ID to 2.

set vap vap1 vlan-id 2

Note: The previous command sets the VLAN ID to 2 for VAP 1 on both radios. To set the VLAN ID for VAP 1 on radio one only, use the following command: set vap 1 with radio wlan0 to vlan-id 2.

- 4.) Set the SSID to Marketing.
- set interface wlan0vap1 ssid Marketing
- 5.) Set the Security Mode to WPA Personal. set interface wlan0vap1 security wpa-personal
- 6.) Allow WPA2 clients, and not WPA clients, to connect to the AP. set bss wlan0bssvap1 wpa-allowed off
- set bss wlan0bssvap1 wpa2-allowed on
 7.) Set the Cipher Suite to CCMP (AES) only.
 set bss wlan0bssvap1 wpa-cipher-tkip off
- set bss wlan0bssvap1 wpa-cipher-ccmp on 8.) Set the Pre-shared key.
 - set interface wlan0vap1 wpa-personal-key JuPXkC7GvY\$moQiUttp2
- If the shared secret keys includes spaces, place the key inside quotation marks.
- 9.) Use the following commands to view and verify the settings.
 - get interface wlan0vap1 detail
 get vap vap1 detail

VAP Configuration Using SNMP

- 1.) Load the DLINK-WLAN-ACCESS-POINT-X600-MIB module.
- 2.) From the MIB tree, navigate to the objects in the apVap table.
- 3.) Walk the apVapDescription object to view the instance ID for VAP 1 (wlan0vap1). VAP 1 on Radio 1 is instance 3.
- 4.) Use the apVapStatus object to set the status of VAP 1 to up (1).
- 5.) Use the apVapVlanID object to set the VLAN ID of VAP 1 to 2.
- 6.) Navigate to the objects in the aplfConfig table.
- Walk the aplfConfigName object to view the instance ID for VAP 1 (wlan0vap1). VAP 1 on Radio 1 is instance 3.
- 8.) Set the value of instance 3 in the aplfConfigSsid object to Marketing.
- 9.) Set the value of instance 3 in the aplfConfigSecurity object to wpa-personal (3).
- 10.) Set the value of instance3 in the aplfConfigWpaPersonalKey object to JuPXkC7GvY\$moQiUttp2, which is the WPA pre-shared key.
- 11.) Navigate to the objects in the apRadioBss > apBssTable table.
- 12.) Walk the apBssDescr object to view the instance ID for VAP 1. VAP 1 on Radio 1 is instance 1.
- 13.) Set the value of instance 1 in the apBssWpaAllowed object to false (2).
- 14.) Set the value of instance 1 in the apBssWpaCipherTkip object to false (2).
- 15.) Set the value of instance 1 in the apBssWpaCipherCcmp object to true (1).

Configuring Radio Settings

This example shows how to configure Radio 12 with the following settings:

- •) Mode: IEEE 802.11b/g/n
- •) Channel: 6
- •) Channel Bandwidth: 40 MHz
- •) Maximum Stations: 100
- •) Transmit Power: 75%

Radio Configuration from the Web Interface

1.) Log onto the AP and navigate to the Manage > Radio page.

Modify radio settings	
	Radio 1 🔻
St	atus 🖲 On 🗇 Off
Node	IEEE 802.11a/n •
Channel	Auto 🔻
Short Guard Interval Supported	Yes •
Protection	Auto 🔻
Beacon Interval	100 (Msec, Ranget 20 - 2000)
DTIM Period	2 (Range: 1-255)
Pregmentation Threahold	2346 (Range: 256-2346, Even Numbers)
RTS Threshold	2347 (Range: 0-2347)
Maximum Stations	200 (Range: 0-200)
Transmit Power	100 (Percent, Range: 1 - 100)
Fixed Nulticent Rate	Auto - Nbps
	Rate Supported Basic
	54 Mbps 📝 📃
	48 Mbpa

Figure 76 - Radio Configuration from the Web Interface

- 2.) Make sure that the Status is On.
- 3.) From the Mode menu, select IEEE 802.11b/g/n.
- 4.) From the Channel field, select 6.
- 5.) From the Channel Bandwidth field, select 40 MHz.
- 6.) In the Maximum Stations field, change the value to 100.
- 7.) In the **Transmit Power** field, change the value to **75**.
- 8.) Click **Apply** to update the AP with the new settings.

Radio Configuration from the CLI

- 1.) Connect to the AP by using Telnet, SSH, or a serial connection.
- 2.) Turn Radio 12 on if the status is not currently up. set radio wlan01 status on
- 3.) Set the mode to IEEE 802.11b/g/n. set radio wlan01 mode bg-n
- 4.) Set the channel to 6. set radio wlan01 channel-policy static set radio wlan01 static-channel 6
- 5.) Set the channel bandwidth to 40 MHz. set radio wlan01 n-bandwidth 40
- 6.) Allow a maximum of 100 stations to connect to the AP at a time. set bss wlan01bssvap0 max-stations 100

- 7.) Set the transmit power to 75 percent. set radio wlan01 tx-power 75
- 8.) View information about the radio settings. get radio wlan01 detail

Radio Configuration Using SNMP

- 1.) Load the DLINK-WLAN-ACCESS-POINT-X600-MIB module.
- 2.) From the MIB tree, navigate to the objects in the apRadio table (apRadioBss > apRadioTable).
- 3.) Use the apRadioStatus object to set the status of Radio 12 to up (1).
- 4.) Use the apRadioMode object to set the Radio 12 mode to IEEE 802.11b/g/n, which is bg-n (4).
- 5.) Use the apRadioChannelPolicy object to set the channel policy to static (1), which disables the automatic channel assignment.
- 6.) Use the apRadioStaticChannel object to set the channel to 6.
- 7.) Use the apRadioChannelBandwith object to set the channel bandwidth for Radio 12 to forty-MHz (2).
- 8.) Use the apRadioTxPower object to set the transmission power on Radio 12 to 75.
- 9.) Navigate to the objects in the apBssTable.
- 10.) Use the apBssMaxStations object to set the value of the maximum allowed stations to 100.

Configuring the Wireless Distribution System

This examples shows how to configure a WDS link between two APs. The local AP is MyAP1 and has a MAC address of 00:1B:E9:16:32:40, and the remote AP is MyAP2 with a MAC address of 00:30:AB:00:00:B0.

The WDS link has the following settings, which must be configured on both APs:

- •) Encryption: WPA (PSK)
- •) SSID: wds-link
- •) Key: abcdefghijk

WDS Configuration from the Web Interface

To create a WDS link between a pair of access points "**MyAP1**" and "**MyAP2**" use the following steps: 1.) Log onto **MyAP1** and navigate to the **Manage > WDS** page.

Confi	gure WDS bri	dges to other access	ss points
Spanning Local Add) Tree Mode fress	Enabled Disat 00:05:5E:80:70:00	abled
Remote /	Address	00:90:4C:01:6D:6C	•
Encryptic SS1D	m wde-link	WPA (PSK) +	
Key	abodefehijk		

Figure 77 - WDS Configuration from the Web Interface

The **MAC address** for **MyAP1** (the access point you are currently viewing) is automatically provided in the **Local Address** field.

- 2.) Enter the **MAC address** for **MyAP2** in the **Remote Address** field, or click the arrow next to the field and select the MAC address of MyAP2 from the pop-up list.
- 3.) Select **WPA (PSK)** from the Encryption menu.
- 4.) Enter wds-link in the SSID field and abcdefghijk in the Key field.
- 5.) Click **Apply** to apply the WDS settings to the AP.
- 6.) Log onto MyAP2 and repeat steps 2-5 (but be sure to use the MAC address of MyAP1 in the Remote Address field.

Note: MyAP1 and MyAP2 must be set to the same IEEE 802.11 Mode and be transmitting on the same channel.

WDS Configuration from the CLI

- 1.) Connect to the MyAP1 by using Telnet, SSH, or a serial connection.
- 2.) Configure the remote MAC address for MyAP2.
- set interface wlan0wds0 status up remote-mac 00:30:AB:00:00:B0
- 3.) Set WPA (PSK) as the encryption type for the link. set interface wlan0wds0 wds-security-policy wpa-personal
 4.) Set the SSID on the WDS link.
- set interface wlan0wds0 wds-ssid wds-link
- 5.) Configure the encryption key. set interface wlan0wds0 wds-wpa-psk-key abcdefghijk
 6.) Administratively enable the WDS link.
- set interface wlan0wds0 status up
- 7.) Perform the same configuration steps on MyAP2.

WDS Configuration Using SNMP

- 1.) Load the DLINK-WLAN-ACCESS-POINT-X600-MIB module.
- 2.) From the MIB tree, navigate to the objects in the aplfConfig table.
- 3.) Walk the aplfConfigName object to view the instance ID for the first WDS link (wlan0wds0). The first WDS link is instance 1.
- 4.) Set the value of instance 1 in the aplfConfigRemoteMac object to 00:30:AB:00:00:B0. In the MG-Soft browser, the format for the MAC address value to set is # 0x00 0x30 0xAB 0x00 0x00 0xB0.
- 5.) Set the value of instance 1 in the aplfConfigWdsSecPolicy object to WPA Personal (3).
- 6.) Set the value of instance 1 in the aplfConfigSsid object to wds-link.
- 7.) Set the value of instance 1 in the aplfConfigWdsWpaPskKey object to abcdefthijk. Some MIB browsers require that the value be entered in HEX values rather than ASCII values.
- 8.) Perform the same configuration steps on MyAP2.

Clustering Access Points

This example shows how to configure a cluster with two APs and to enable automatic channel reassignment. The location of the local AP is Room 214, and the cluster name is MyCluster.

Clustering APs by Using the Web Interface

1.) Log onto the AP and navigate to the **Cluster > Access Points** page.

Manage access	points in the cluster			
This access point is opera This access point is opera "start clustering" button t Start Clustering	ating in stand-alone mode ating in stand-alone mode, and below.	is not managed as part of a cluster. You can choose to manage this access point as part of a cluster. To do this, press the	Not Clustered Access Points	?
Clustering Options.	 AD.

Enter the name of the du	ster for this AP to join.			
Cluster Name: Cl	luster1			
Clustering IP Version: 🔘) IPv6 🖲 IPv4			
Click "Apply" to save the r Apply	new settings.			

Figure 78 - Clustering APs by Using the Web Interface (Passive)

- 2.) If clustering has started, click Stop Clustering so you can change the Clustering Options.
- 3.) Enter the AP location and the name of the cluster for it to join.
- 4.) Click Apply.

- 5.) Click **Start Clustering** to enable the clustering feature.
- After you refresh the page, other APs that are on the same bridged segment, have radios in the same operating mode, are enabled for clustering, and have the same cluster name appear in the Access Points table.
- 6.) Go to the **Channel Management** page to view the channel assignments.

```
Automatically manage channel assignments
Channels ....
Stop automatically re-assigning channels
Current Channel Assignments
                                                                                                                                                         R9

  Change channels if interference is reduced by at least 75\% \checkmark
       ine if there is better set of channel settings every 1 Hour
                                                        Apply
```

Figure 79 - Clustering APs by Using the Web Interface (Active)

A table on the page displays the current channel assignments and the proposed channel assignments. The interval setting in the Advanced section determine how often proposed changes are applied.

Clustering APs by Using the CLI

- 1.) Connect to the AP by using Telnet, SSH, or a serial connection.
- 2.) Stop clustering so you can change the location and cluster name.

```
set cluster clustered 0
3.) Set the AP Location.
```

set cluster cluster-name "Room 214"

Note: If the cluster name or cluster location has spaces, you must enclose the text in quotation marks when you enter the text in the CLI, as the command example shows. You do not need to use quotation marks when you enter text by using the Web UI.

- 4.) Set the cluster name. set cluster location MyCluster
- 5.) Start clustering. set cluster clustered 1
- 6.) View information about the cluster settings on the AP. get cluster detail
- 7.) Start the automatic channel planner. set channel-planner status up
- 8.) View the settings for the automatic channel planner. get channel-planner detail

Clustering APs by Using SNMP

Cluster configuration by using SNMP is not supported.

Configuring Client QoS

This example shows how to enable client QoS, configure an ACL and a DiffServ policy on the AP, and to apply the ACL and the Policy to traffic transmitted from clients associated with VAP 2 and received by the AP.

The IPv4 ACL is named acl1 and contains two rules. The first rule allows HTTP traffic from the 192.168.1.0 subnet. The second rule allows all IP traffic from the management station (192.168.1.23). All other traffic is denied due to the implicit deny all rule at the end of the ACL. The ACL is applied to the inbound interface on the AP so that packets are checked when the AP receives traffic from associated clients.

The DiffServ policy in this example shows how to establish default DiffServ behaviour for clients associating with the VAP that do not obtain a DiffServ policy name through the RADIUS server. Voice traffic (UDP packets) received from clients in the 192.168.1.0 subnet that has the VoIP server as its destination address (192.168.2.200), is marked with the IP DSCP value for expedited forwarding so that it takes priority over other traffic.

Configuring QoS by Using the Web Interface

ACL Configuration

- 1.) Log onto the AP and navigate to the Client QoS > Client QoS ACL page.
- 2.) Enter *acl1in* the **ACL Name** field, and click **Add ACL**.

Configure Client QoS ACL Settings

- 17.) Click **Apply** to update the AP with the QoS settings.

Configuring QoS by Using the CLI

ACL Configuration

- 1.) Connect to the AP.
- 2.) Create an ACL named acl1. add acl acl1 acl-type ipv4
- 3.) Add a rule to acl1 that allows HTTP traffic from the 192.168.1.0 subnet. add rule acl-name acl2 acl-type ipv4 action permit protocol ip src-ip 192.168.1.0 src-ipmask 0.0.0.255 src-port http

- 4.) Add another rule to acl1 that allows all traffic from the host with an IP address of 192.168.1.23. add rule acl-name acl2 acl-type ipv4 action permit protocol ip src-ip 192.168.1.23 src-ipmask 0.0.0.0
- 5.) Enable Client QoS on the AP. set client-gos mode up
- 6.) Enable Client QoS on VAP2 set vap wlan0vap2 gos-mode up
- 7.) Apply acl1 to VAP2 in the inbound direction (from the client to the AP).
 - set vap wlan0vap2 def-acl-up acl1

DiffServ Configuration

- 1.) Log onto the AP CLI.
- 2.) Create a class map named class_voip and configure it to match all UDP packets from the 192.168.1.0 network that have a destination IP address of 192.168.2.200 (the VoIP server). add class-map class_voip every yes protocol udp src-ip 192.168.1.0 src-ip-mask 255.255.255.0 dst-ip 192.168.2.200 dst-ip-mask 255.255.255.255
- 3.) Add a policy map named pol_voip. add policy-map pol voip
- 4.) Define the pol_voip policy map by adding the class_voip class map and specifying that packets that match the class_voip criteria will be marked with a DSCP value of EF (expedited forwarding).
- add policy-attr policy-map-name pol_voip class-map-name class_voip mark-ip-dscp ef
- 5.) Enable Client QoS on the AP. set client-gos mode up
- 6.) Enable Client QoS on VAP2 set vap wlan0vap2 gos-mode up
- 7.) Apply pol_voip to VAP2 in the inbound direction (from the client to the AP). set vap wlan0vap2 def-policy-up pol_voip Configuring QoS by Using SNMP

ACL Configuration

- 1.) Load the DLINK-WLAN-ACCESS-POINT-X600-MIB module.
- 2.) From the MIB tree, navigate to the objects in the apQos > apAclTable.
- 3.) Use the apQosAclStatus object to create a row entry with apQosAclName and apQosAclType as the indexes for apQosAclEntry.

The new apQosAclEntry value includes the apQosAclType (1) followed by the number of characters in the name (4), and then the ASCII code for the name. In this example, acl1 is 97.99.108.49. The value to set is 4, which is Create and Go.

- 4.) Add a rule to acl1 that allows HTTP traffic from the 192.168.1.0 subnet.
 - •) Use 1.3.6.1.4.1.171.10.128.1.1.26.10.3.1.14.1.4.97.99.108.49.1 to set the apQosAclRuleStatus of Rule 1 to active (1)

In the OID, the **14** (bold) is the sequence identifier for the apQosAclRuleStatuss object, **1** is the ACL type, **4.97.99.108.49** is the ACL name (the number of characters followed by the ASCII code), and the final **1** is the ACL rule number.

- •) Use 1.3.6.1.4.1.171.10.128.1.1.26.10.3.1.4.1.4.97.99.108.49.1 to set the apQosAclRuleSrcIpAddress to a value of 192.168.1.0.
- •) Use 1.3.6.1.4.1.171.10.128.1.1.26.10.3.1.5.1.4.97.99.108.49.1 to set the apQosAclRuleSrcIpMask to a value of 0.0.0.255.
- •) Use 1.3.6.1.4.1.171.10.128.1.1.26.10.3.1.3.1.4.97.99.108.49.1 to set apQosAclRuleProtocol to a value of 80 (HTTP).
- •) Use 1.3.6.1.4.1.171.10.128.1.1.26.10.3.1.16.1.4.97.99.108.49.1 to set apQosAclRuleCommit to a value of 1 (true), which saves the rule.
- 5.) Add another rule to acl1 that allows all traffic from the host with an IP address of 192.168.1.23.
 - •) Use 1.3.6.1.4.1.171.10.128.1.1.26.10.3.1.14.1.4.97.99.108.49.2 to set the apQosAclRuleStatus of Rule 2 to active (1)
 - •) Use 1.3.6.1.4.1.171.10.128.1.1.26.10.3.1.4.1.4.97.99.108.49.2 to set the apQosAclRuleSrcIpAddress to a value of 192.168.1.23.
 - •) Use 1.3.6.1.4.1.171.10.128.1.1.26.10.3.1.5.1.4.97.99.108.49.2 to set the apQosAclRuleSrcIpMask to a value of 0.0.0.0.

- •) Use 1.3.6.1.4.1.171.10.128.1.1.26.10.3.1.16.1.4.97.99.108.49.2 to set apQosAclRuleCommit to a value of 1 (true), which saves the rule.
- 6.) Use the apQosGlobalMode object to set the status to up (1), which enables Client QoS on the AP.
- 7.) Walk the apVapDescription object to view the instance ID for VAP 2 (wlan0vap2).
- VAP 2 on Radio 1 is instance 5.
- 8.) Use the apVapQosMode object to set the status of VAP 2 to up (1).
- 9.) Use the apVapAclUp object to apply acl1 to VAP2 in the inbound direction (from the client to the AP). The ACL name is the text string, and not the ASCII code.

DiffServ Configuration

- 1.) Load the DLINK-WLAN-ACCESS-POINT-X600-MIB module.
- 2.) From the MIB tree, navigate to the objects in the apQos > apAclTable.
- Use the apQosDsClassMapStatus object to set the status of the class map named class_voip to Create and Go (4).

The OID to set is 1.3.6.1.4.1.171.10.128.1.1.26.10.4.1.3.10.99.108.97.115.115.95.118.111.105.112, where 10 is the number of characters, and 99.108.97.115.115.95.118.111.105.112 is class_voip in ASCII code.

- 4.) Configure class_voip to match all UDP packets from the 192.168.1.0 network that have a destination IP address of 192.168.2.200 (the VoIP server).
 - •) Set apQosDsClassMapMatchEvery to true (1).
 - •) Set apQosDsClassMapMatchProtocol to UDP (17).
 - •) Set apQosDsClassMapMatchSrcIpAddress to 192.168.1.0.
 - •) Set apQosDsClassMapMatchSrcIpMask to 255.255.255.0.
 - •) Set apQosDsClassMapMatchDestIpAddress to 192.168.2.200.
 - •) Set apQosDsClassMapMatchDestIpMask to 255.255.255.255
 - •) Set apQosDsClassMapMatchCommit to true (1).
- 5.) Create a policy map named pol_voip (which is **112.111.108.95.118.111.105.112** in ASCII) by setting the value of the OID 1.3.6.1.4.1.171.10.128.1.1.26.10.5.1.2.8.**112.111.108.95.118.111.105.112** to Create and Go (4).
- 6.) Define the pol_voip policy map by adding the class_voip class map and specifying that packets that match the class_voip criteria will be marked with a DSCP value of EF (expedited forwarding).
 - •) Set

apQosDsPolicyMapAttrStatus.8.112.111.108.95.118.111.105.112.10.99.108.97.115.115.95.118.111.105.112.1 to a value of 4 (Create and Go)

•) Set

apQosDsPolicyMapAttrMarkIpDscp.8.112.111.108.95.118.111.105.112.10.99.108.97.115.115.95.118.111.105. 112.1 to 46 (which is the equivalent of ef).

7.) Enable Client QoS on the AP.

set client-qos mode up

- 8.) Use the apQosGlobalMode object to set the status to up (1), which enables Client QoS on the AP.
- 9.) Walk the apVapDescription object to view the instance ID for VAP 2 (wlan0vap2).
 - VAP 2 on Radio 1 is instance 5.
- 10.) Use the apVapQosMode object to set the status of VAP 2 to up (1).
- 11.) Use the apVapPolUp object to apply pol_voip to VAP2 in the inbound direction (from the client to the AP).

The policy name is the text string, and not the ASCII code.

Appendix C - DWL-6700AP Profile and Configuration Table

DWL-6700AP doesn't support some features like, IEEE 802.1X Authentication, CLI command (no console port supported), TSPEC etc..., details please see the following table.

Radio Configuration	DWL-6700AP	DWL-6600AP
Radio mode	Yes	Yes
Radio configuration state	Yes	Yes
RTS threshold	Yes	Yes
Load Balancing	NO	Yes
Load Utilization	NO	Yes
Maximum Clients	Yes	Yes
RF Scan Other Channels	NO	Yes
RF Scan Sentry	NO	Yes
Mode	Yes	Yes
DTIM Period	Yes	Yes
Beacon Interval	Yes	Yes
Automatic Channel	Yes	Yes
Automatic Power	Yes	Yes
Initial Power	Yes	Yes
APSD mode	NO	Yes
RF Scan Interval (secs)	Yes	Yes
Frag Threshold (bytes)	Yes	Yes
RF Scan Sentry Channels	NO	Yes
Radio Configuration	DWL-6700AP	DWL-6600AP
Short Retries	NO	Yes
RF Scan Duration (msecs)	Yes	Yes
Long Retries	NO	Yes
Rate Limiting	NO	Yes
Transmit Lifetime (msecs)	NO	Yes
Rate Limit (pkts/sec)	NO	Yes
Receive Lifetime (msecs)	NO	Yes
Rate Limit Burst (pkts/sec)	NO	Yes
Station Isolation	Yes	Yes
Channel Bandwidth	Yes	Yes
Primary Channel	Yes	Yes
Protection	Yes	Yes
Short Guard Interval	Yes	Yes
Space Time Block Code	NO	Yes
Radio Resource Management	NO	Yes
NO ack	NO	Yes
Multicast TX rate (Mbps)	Yes	Yes
Network Configuration	DWL-6700AP	DWL-6600AP
SSID	Yes	Yes
Hide SSID	Yes	Yes
Ignore Broadcst	Yes	Yes
VLAN	Yes	Yes

MAC Authentication	Yes	Yes
Redirect	NO	Yes
Redirect URL	NO	Yes
Wireless ARP Suppression Mode	NO	Yes
L2 Distributed Tunneling Mode	NO	Yes
RADIUS Autentication Server Name	NO	Yes
RADIUS Autentication Server Status	NO	N/A
RADIUS Accounting Server Name	NO	Yes
RADIUS Accounting Server Status	NO	N/A
RADIUS Use Network Configuraiton	NO	Yes
RADIUS Accounting	NO	Yes
Security	Yes	Yes
WPA Versions	Yes	Yes
WPA Ciphers	Yes	Yes
Network Configuration	DWL-6700AP	DWL-6600AP
WPA Кеу Туре	Yes	Yes
WPA Key	Yes	Yes
Bcast Key Refresh Rate (seconds)	NO	Yes
WDS Configuration	DWL-6700AP	DWL-6600AP
ACK Timer Value (Standalone mode)	Yes	NO
Others	DWL-6700AP	DWL-6600AP
Turn Off all LEDs via GUI (Standalone mode)	Yes	NO

Federal Communication Commission Interference Statement

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.

• Connect the equipment into an outlet on a circuit different from that to which the receiver is connected. • Consult the dealer or an experienced radio/TV technician for help.

FCC Caution:

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Non-modification Statement:

Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

FCC Radiation Exposure Statement:

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20cm between the radiator & your body.

Industry Canada Statement

This device complies with RSS-247 of Industry Canada

Operation is subject to the following two conditions: (1) this device may not cause interference, and (2) this device must accept any interference, including interference that may cause undesired operation of the device.

The device for operation in the band 5150-5250 MHz is only for indoor use to reduce the potential for harmful interference to co-channel mobile satellite systems. The maximum antenna gain permitted for devices in the band 5725-5825 MHz shall comply with the e.i.r.p. limits specified for point-topoint and non point-to-point operation as appropriate.

IC Radiation Exposure Statement

This equipment complies with IC RSS-102 radiation exposure limit set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20cm between the radiator and your body.

Avis d'industrie Canada

Le présent appareil est conforme aux CNR d'Industrie Canada applicables aux appareils radio exempts de licence.

L'exploitation est autorisée aux deux conditions suivantes:

(1) l'appareil ne doit pas produire de brouillage, et, and

(2) l'utilisateur de l'appareil doit accepter tout brouillage radioélectrique subi, même si le brouillage est susceptible d'en compromettre le fonctionnement.

Les dispositifs fonctionnant dans la bande 5150-5250 MHz sont réservés uniquement pour une utilisation à l'intérieur afin de réduire les risques de brouillage préjudiciable aux systèmes de satellites mobiles utilisant les mêmes canaux. Le gain maximal d'antenne permis (pour les dispositifs utilisant la bande 5725-5825 MHz) doit se conformer à la limite de p.i.r.e. spécifiée pour l'exploitation point à point et non point à point, selon le cas.

Déclaration d'exposition à la radiation : Cet équipement respecte les limites d'exposition aux rayonnements IC définies pour un environnement non contrôlé. Cet équipement doit être installé et mis en marche à une distance minimale de 20 cm qui sépare l'élément rayonnant de votre corps.

L'émetteur ne doit ni être utilisé avec une autre antenne ou un autre émetteur ni se trouver à leur proximité.
