This wireless mobile device has demonstrated compliance with the applicable technical standards as indicated in the measurement report and was tested in accordance with the measurement procedures specified in FCC 47 CFR Parts 2, 15.247, 22H, 24E, Industry Canada RSS 133 Issue 2, RSS-132 Issue 1 (Provisional), RSS-210 Issue 5; and ANSI TIA/EIA-603-A-2002.

I attest to the accuracy of the data. All measurements reported herein were performed by me or were under my supervision and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements and vouch for the qualifications of all persons taking them.

This test report shall not be reproduced partially, or in full, without the prior written approval of Celltech Labs Inc. The results and statements contained in this report pertain only to the device(s) evaluated.

### 1.0 <u>SCOPE</u>

This report outlines the measurements made and results collected during electromagnetic emissions testing of the Itronix Corporation IX260+ Rugged Laptop PC with internal Cirronet BT2022 Bluetooth Transmitter cotransmitting with the Sierra Wireless AirCard 555/550 Dual-Band CDMA PCMCIA Modem. The Bluetooth transmitter was connected to the Rangestar internal surface-mount antenna located in the upper left side edge of the LCD display. The Dual-Band CDMA Modem was connected to an external swivel dipole antenna located on the upper right side edge of the LCD display. The IX260+ also has the option of being mounted in a vehicle cradle, with the Dual-Band CDMA Modem utilizing a vehicle-mount antenna. The vehicle antenna option was not considered to be worst case when investigating the co-transmitting effects, and therefore was not used in obtaining the data presented in this report. This report describes the results obtained when inter-modulation product and related measurements were made with both transmitters installed in the IX260+ Rugged Laptop PC as described, and transmitting simultaneously. The measurement results were applied against the applicable EMC requirements and limits outlined in the technical rules and regulations set forth in the Federal Communication Commission Code of Federal Regulations Title 47 Part 2, 15 subpart C, 22 subpart H and 24 subpart E.

### 4.0 FACILITIES AND ACCREDITATIONS

The facilities used in collecting the test results outlined in this report are located at 1955 Moss Court, Kelowna, British Columbia, Canada, V1Y 9L3. The radiated and conducted emissions sites conform with the requirements set forth in ANSI C63.4 and are filed and listed with the FCC under Registration Number 714830 and Industry Canada under File Number IC 3874.

### 5.0 GENERAL INFORMATION

Company Name:	Itronix Corporation
Address:	801 South Stevens Street
	Spokane, WA 99204
	United States

#### 5.2 DUT Description

The DUT consisted of the IX260+ Rugged Laptop PC containing a Cirronet BT2022 Bluetooth Transmitter connected to an Internal Surface-Mount Antenna installed in the upper left side edge of the LCD display. Co-located in the IX260+ Rugged Laptop PC was a Sierra Wireless AirCard 555/550 Dual-Band CDMA PCMCIA Modem connected to an External Swivel Dipole Antenna located on the upper right side edge of the LCD display. The IX260+ has the option of being mounted in a vehicle cradle, with the Dual-Band CDMA Modem utilizing a vehicle-mount antenna. The vehicle antenna option was not considered to be worst case, and therefore was not used in obtaining the data presented in this report. Photographs of the DUT placement and construction are shown in Appendix A.

### 5.7 Mode(s) of Operation Tested

### 5.7.1 Dual-Band CDMA Modem

Customer supplied software was used to set the CDMA Modem to the appropriate channel and power level for the specific measurement. Measurements were made with the CDMA modem set to each extreme channel, in each band while the Bluetooth was co-transmitting. The following settings where used for each channel.

#### 5.7.1.1 Cellular CDMA

TX Frequency Range:	824.7 – 848.31 MHz Ch. 1013 (824.700 MHz) & Ch. 777 (848.310 MHz) measured unless otherwise noted
Software Power Gain Settings:	Ch. 1013 – 234 Ch. 777 - 237
RF Peak Conducted Output Power Tested:	Ch. 1013 - +22.92 dBm Ch 777 - +22.99 dBm
Battery Type(s):	11.1V Lithium-ion, 6.0Ah (Model: A2121-2)
Modulation Type:	QPSK

#### 5.7.1.2 PCS CDMA

TX Frequency Range:	1851.25 – 1908.75 MHz Ch. 25 (1851.25 MHz) & Ch. 1175 (1908.75 MHz) measured unless otherwise noted
Software Power Gain Settings:	Ch. 25 - 250 Ch. 1175 - 250
RF Peak Conducted Output Power Tested:	Ch. 25 - +23.06 dBm Ch 1175 - +22.67 dBm
Battery Type(s):	11.1V Lithium-ion, 6.0Ah (Model: A2121-2)
Modulation Type:	QPSK

#### 5.7.2 Bluetooth Transmitter

Customer supplied software was used to set the Bluetooth transmitter to the appropriate mode, power level and modulation for the specific measurement. During the co-transmission testing, the Bluetooth transmitter was placed in hopping mode with the following settings:

TX Frequency Range:	2402 – 2480 MHz
Software Power Gain Settings:	220 /45
RF Peak Conducted Output Power Tested:	Ch. 0 - +14.84 dBm (same settings as single transmit), +16.28 with 220/45 gain settings* Ch. 39 - +15.46 dBm (same settings as single transmit), +15.84 with 220/45 gain settings* Ch. 78 - +15.09 dBm (same settings as single transmit), +15.15 with 220/45 gain settings* *gain settings used during hopping mode
Modulation Type(s):	GFSK 0.5 BT Gaussian

#### 5.7.3 DUT Exercising Software Description

The DUT was configured and exercised using customer supplied test software that allowed an operator to set the parameters of the Bluetooth transmitter and Dual-Band CDMA modem operation. The settings used are described in each appendix. More specific information on the configuration and exercising can be found in the referenced single-transmit test reports.

#### 5.8 Configuration Description

The DUT was configured, as described by the client as being representative of what would be delivered to a final customer. Because the swivel dipole antenna orientation can be user configured, prescan evaluations were made to determine the configuration that resulted in the highest emissions. A "horizontal, pointing back" orientation was used for the cellular band, "vertical, pointing up" was used for the PCS band. More specific details may be included in each appendix.

#### 5.8.1 Configuration Justification

The DUT was tested in a configuration described by the client as being worse case but typical of normal use. The system is available for use while installed in a mobile cradle, using a vehicular mounted dipole antenna and the resulting measurements using this configuration were investigated and reported in the single transmitting report. Given that the use of the mobile antenna resulted in greater separation in transmit antennas and lower dominant transmit power, only the worse case configuration using the swivel dipole antenna was used to investigate the co-transmission effects reported herein.

#### 6.0 PASS/FAIL CRITERIA

Unless otherwise noted in the Appendices, the pass/fail criteria is the limit set forth in the reference standards. A DUT is considered to have passed the requirements, if the data collected during the described measurement procedure is no greater than the specified limits as defined. The pass/fail statements made in this report only apply to the unit tested.

B.5. MEASUREMENT EQUIPM	B.5. MEASUREMENT EQUIPMENT SETUP							
MEASUREMENT EQUIPMENT CONNECTIONS	The conducted emissions were measured on each of the two AC powerline leads connected to the DUT's power supply brick. A two line LISN was used to make this measurement. A drawing of the equipment setup is shown in B.7							
MEASUREMENT EQUIPMENT SETTINGS	Each of the monitor ports from the 2-line LISN was connected in turn to the spectrum analyzer. The port not connected to the analyzer was terminated in a 50-ohm load. A pre-scan of the peak emission levels was made of the 150 kHz – 30 MHz range split into 4 equal frequency bands. The following were the instrumentation settings: Spectrum Analyzer: Start Frequency and Stop Frequency set by software for each of the four bands RBW: 100 kHz VBW: 300 kHz Sweep: 500 mS							
	<ul> <li>Quasi-Peak Adapter: Normal - Automatic Bandwidth Setting: 9 kHz</li> <li>The resulting data from each band was corrected and collected by software and presented in the graphical representations shown in B.9 for the two leads.</li> <li>A defined set of frequency points of interest on each lead were used by software to optimize a set of readings for each type of detector (peak, quasi-peak and average). This data was corrected by the software is presented in the tables shown in section B.9.</li> </ul>

B.8. DUT OPERATING DESCRIPTION					
Bluetooth	While hopping channels, the Bluetooth transmitter was set to transmit a data stream with a max. power setting equivalent to that described in the referenced single-transmit test report.				
Dual-Band CDMA	The Dual-Band CDMA modem was set to transmit on the channel with the highest radiated power (Ch 1013) with power settings equivalent to that described in the referenced single-transmit test report.				
PC	Other than operating the Bluetooth software and running MS windows, no PC exercising was performed.				
Peripherals	All peripherals were active, but no specific traffic was initiated.

#### B.10. PASS/FAIL

In reference to the results outlined in B.9 the DUT passes the requirements as stated in the reference standards as follows: The RF voltage measured in reference to ground on each of the power line conductors does not exceed the limits as outline in FCC 15.207.

#### B.11. SIGN-OFF

I attest to the accuracy of the data. All measurements reported herein were performed by me and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements.

C.5. MEASUREMENT EQUIPMENT SETUP					
Measurement Equipment Connections	The equipment was connected as shown in the setup drawing in C.6.				
Measurement Equipment Settings	To evaluate the maximum peak power, the 26 dB bandwidth needs to be determined. This is performed with the spectrum analyzer using the following setting: RBW – 300 kHz VBW – 1MHz Span – 50 MHz Detector – Peak Average – Power Trace Average – 100 Once the 26 dB bandwidth is determined, the channel power is measured within the band with the following spectrum analyzer settings: RBW – 1 MHz VBW – 3 MHz Detector – Peak Average – Power Integrate BW – equal to specific -26 dB EBW				

#### C.7. DUT OPERATING DESCRIPTION

Measurements were made at three channels throughout the band, Low Channel (0) (2402 MHz), Mid Channel (39) (2441 MHz), High Channel (78) (2480 MHz).

Applicant:	Itronix Corporation	Model:	IX260P-AC555BT	FCC ID:	KBCIX260P-AC555BT	IC ID:	1943A-IX260Pb

D.5. MEASUREMENT EQUIPMENT SETUP								
MEASUREMENT	The measurement equipment w the applicable frequency range							
EQUIPMENT	Frequency F	Range	Ante	nna				
CONNECTIONS	30 MHz – 1	GHz	Dipo	ole				
	1 GHz – 18	GHz	ETS 311	15 Horn				
	For the spurious out-of-band emissions, the spectrum analyzer was set to the following settings:							
	Frequency Range	RBW	VBW	Detector				
	MHz	kHz	kHz					
MEASUREMENT	<1000	100	300	Peak <sup>2</sup>				
EQUIPMENT	> 1000	1000*	1000	Peak <sup>2</sup>				
SETTINGS	Note 1: Only ranges where inter-modulation products might occur were investigated. Note 2: As a worse case measurement, the average limit was applied to measurements made with a peak detector using a RBW of 1 MHz (vs the specified 100 kHz), when possible.							
	For the Bluetooth band-edge delta-marker radiated measurements, the spectrum analyzer was set for 30 kHz RBW and VBW and the delta marker applied to radiated carrier levels measured at a 3-meater distance with the resolutions as defined above.

#### D.8. DUT OPERATING DESCRIPTION

Measurements were made of the bands that may contain inter-modulation products with both the Bluetooth and CDMA radios transmitting. Measurements were made for each combination of low and high CDMA channel transmitting while the Bluetooth was in hopping mode. The Bluetooth power setting was set to worse case (highest recorded conducted power) with CDMA power settings equivalent to those described in the referenced single-transmit test reports.

#### D.9. TEST RESULTS

With the exception of the Cellular and PCS CDMA block-edge and Bluetooth band-edge measurements not adjacent to restricted bands, all significant inter-modulations products or representative noise floor levels were measured as they related to the restricted band limit. This comparison was worst-case (versus an out of band emission limit comparison) and is described in Appendix E of this report. The band-edge as described above is presented in the following tables. The CDMA block-edge is presented in Appendix H. All other spurious emissions are described in the appropriate sections in the individual reports referenced.

#### D.10. PASS/FAIL

In reference to the results outlined in D.9 & E.9, the DUT passes the requirements as stated in the reference standards as follows:

FCC 15.247 (c): All emissions within any 100kHz bandwidth outside the operating frequency band are greater than 20 dB below the maximum 100 kHz bandwidth signal within the operating band.

#### D.11. SIGN-OFF

I attest to the accuracy of the data. All measurements reported herein were performed by me and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements.

usull W. Pupe

Photograph E-1 – 3115 Vertical Polarization (10 GHz – 18 GHz)						
Photograph E-2 - Front of Radiated Emission Configuration	Photograph E-3 - Back of Radiated Emission Configuration					

### E.8. DUT OPERATING DESCRIPTION

Measurements were made of the bands that may contain inter-modulation products with both the Bluetooth and CDMA radios transmitting. Measurements were made for each combination of low and high CDMA channel transmitting while the bluetooth was in hopping mode. The bluetooth power setting was set to worse case (highest recorded conducted power) with CDMA power settings equivalent to those described in the referenced single-transmit test reports.

\*Where there is acceptable margin between the peak emission reported and the average limit stated, the average limit is referenced. Where the average limit is exceeded by the peak emission or the margin unacceptable, the peak limit is referenced and an average measurement made and referenced to the average limit.

The frequency points reported describe the highest local emission measured and are used to describe the measured inter-modulation product or band-edge of interest. No out-of-band emissions were measured above the levels noted.

### E.10. PASS/FAIL

In reference to the results outlined in E.9, the DUT passes the requirements as stated in the reference standards as follows:

FCC 15.205 (a) (b) and 15.209 (a): No emissions were measured within the restricted bands as outlined in 15.205 that exceeded the limits stated in 15.209.

#### E.11. SIGN-OFF

I attest to the accuracy of the data. All measurements reported herein were performed by me and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements.

G.5. MEASUREMENT	G.5. MEASUREMENT EQUIPMENT SETUP						
Measurement Equipment Connections	The equipment was connected as shown in the setup drawing in G.6.						
Measurement Equipment Settings	Power Meter Settings: Mode – MAP Frequency compensation set for carrier frequency Offset set appropriately for carrier frequency and attenuator characteristics						
Measurement Procedure	The RF conducted power levels for both PCS and cellular bands were measured at the DUT antenna connector port using a Gigatronics 8652A Universal Power Meter in mean average power mode. An offset was entered into the power meter to correct for the losses of the attenuator and cable installed between the transmitter output port and the power sensor input. The DUT test software was used to set it to transmit in the CDMA "always up" power control mode. All subsequent tests were performed using the same power measurement procedures.

## **G.7. DUT OPERATING DESCRIPTION**

During this evaluation, the Bluetooth transmitter was set to co-transmit in a hopping mode as described in section 5.7.2. Power measurements were then made of each channel in both the cellular and PCS bands, with the CDMA modem set appropriately as described in section 5.7.1

G.8. TEST RESULTS						
Mode	Channel	Frequency	Conducted Power			
Cellular CDMA	1013	824.7 MHz	+22.92 dBm			
	363	835.89 MHz	+22.96 dBm			
	777	848.31 MHz	+22.99 dBm			
PCS CDMA	25	1851.25 MHz	+23.06 dBm			
	600	1880.00 MHz	+22.87 dBm			
	1175	1908.75 MHz	+22.67 dBm			

## G.9. PASS/FAIL

As a reference with the single transmit conducted RF power levels, the output of the CDMA transmitter was reduced by a maximum of 0.33 dB when co-transmitting with the Bluetooth transmitter.

## G.10. SIGN-OFF

I attest to the accuracy of the data. All measurements reported herein were performed by me and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements.

## H.8. DUT OPERATING DESCRIPTION

Measurements were made of the bands that may contain inter-modulation products with both the Bluetooth and CDMA radios transmitting. Measurements were made for each combination of low and high CDMA channel transmitting while the Bluetooth was in hopping mode. The bluetooth power setting was set to worse case (highest recorded conducted power) with CDMA power settings equivalent to those described in the referenced single-transmit test reports.

#### H.9. TEST RESULTS

With the exception of the block-edge measurements, all significant inter-modulations products or representative noise floor levels were measured as they related to the FCC 15.205/209 restricted band limit. This comparison was worst-case (versus an out-of-band emission limit comparison) and is described in Appendix E of this report. The CDMA block-edge measurements are presented in the tables below. All other spurious emissions are described in the appropriate sections in the individual reports referenced.

#### H.10. PASS/FAIL

In reference to the results outlined in E.9 and H.9, the DUT passes the requirements as stated in the reference standards\*

\* With the exception of the block-edge measurements, the Part 15.205 & 209 limits will be applied since the emissions being investigated are inter-modulation products with the Bluetooth and these limits are lower then those defined in Part 22 and 24.

## H.11. SIGN-OFF

I attest to the accuracy of the data. All measurements reported herein were performed by me and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements.
