This wireless mobile device has demonstrated compliance with the applicable technical standards as indicated in the measurement report and was tested in accordance with the measurement procedures specified in FCC 47 CFR Parts 2, 15.247, 22H, 24E, Industry Canada RSS 133 Issue 2 Revision 1, RSS-132 Issue 1 (Provisional), RSS-210 Issue 5; and ANSI TIA/EIA-603-C-2004.

I attest to the accuracy of the data. All measurements reported herein were performed by me or were under my supervision and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements and vouch for the qualifications of all persons taking them.

This test report shall not be reproduced partially, or in full, without the prior written approval of Celltech Labs Inc. The results and statements contained in this report pertain only to the device(s) evaluated.

# 1.0 <u>SCOPE</u>

This report outlines the measurements made and results collected during electromagnetic emissions testing of the Itronix Corporation Model: IX260PNLA580BT Rugged Laptop PC with internal Cirronet BT2022 Bluetooth Transmitter co-transmitting with the Sierra Wireless AirCard 580 Dual-Band CDMA PCMCIA Modem. The purpose of this investigation was to determine the co-transmitting effects such as inter-modulation products due to the transmitters transmitting simultaneously.

The Bluetooth transmitter was connected to an internal RangeStar surface-mount antenna installed at the top left side rear of the LCD display. The Dual-Band CDMA Modem was connected to an external swivel dipole antenna located on the upper right side edge of the LCD display. The Laptop PC also has the option of being mounted in a vehicle cradle, with the Dual-Band CDMA Modem utilizing a vehicle-mount antenna. Because of the large antenna separations and low Bluetooth power, the vehicle antenna option was not considered to be worst-case when investigating the co-transmitting effects, and therefore was not used in obtaining the data presented in this report.

The measurement results were applied against the applicable EMC requirements and limits outlined in the technical rules and regulations set forth for the dominant transmitter in the Federal Communication Commission Code of Federal Regulations Title 47 Part 2, Part 15 Subpart C, Part 22 Subpart H, and Part 24 Subpart E; and Industry Canada Radio Standards Specifications RSS-132 Issue 1 (Provisional) and RSS-133 Issue 2, RSS-210 Issue 5.

## 4.0 FACILITIES AND ACCREDITATIONS

The facilities used in collecting the test results outlined in this report are located at 1955 Moss Court, Kelowna, British Columbia, Canada, V1Y 9L3. The radiated and conducted emissions sites conform with the requirements set forth in ANSI C63.4 and are filed and listed with the FCC under Registration Number 714830 and Industry Canada under File Number IC 3874.

## 5.0 GENERAL INFORMATION

	United States

## 5.2 DUT Description

The DUT consisted of the IX260+ Rugged Laptop PC containing a Cirronet BT2022 Bluetooth Transmitter connected to an Internal Surface-Mount Antenna installed in the upper left side rear edge of the LCD display. Colocated in the IX260+ Rugged Laptop PC was a Sierra Wireless AirCard 580 Dual-Band CDMA PCMCIA Modem connected to an External Swivel Dipole Antenna located on the upper right side edge of the LCD display. The DUT has the option of being mounted in a vehicle cradle with the Dual-Band CDMA Modem utilizing a vehicle-mount antenna. The vehicle antenna option was not considered to be worst case, and therefore was not used in obtaining the data presented in this report. Photographs of the DUT placement and construction are shown in Appendix A.

### **5.6 Clock Frequencies**

## 5.6.1 DUT Clock Frequencies

Device:	Rugged Laptop PC
Clocks:	1.6 GHz processor
Device:	Dual-Band PCS/Cellular CDMA Modem
Clocks:	n/a
Device:	2.4GHz FHSS Cirronet Bluetooth Transmitter
Clocks:	n/a
Device:	Vehicle Cradle
Clocks:	None
Device:	External Swivel Dipole Antenna
Clocks:	None
Device:	Internal Dual Surface-Mount Antennas
Clocks:	None
Device:	Vehicle-Mount Antenna
Clocks:	None

## 5.6.2 Co-Located Clock Frequencies

Device:	Peripherals
Clocks:	n/a

### 5.7 Mode(s) of Operation Tested

## 5.7.1 Dual-Band CDMA Modem

Customer supplied software was used to set the CDMA Modem to the appropriate channel and power level for the specific measurement or a CDMA test set was used to transmit a signal close to the DUT and initiate an "all ups" call on the appropriate channel. Measurements were made with the CDMA modem set to the low, mid, and high channels, in each band or on the worst-case channel (1013 or 25) for the measurement as required by the specific test. Worst-case co-transmitting conditions/channels were determined during prescan evaluations. The following settings were used for each channel.

## 5.7.1.1 Cellular CDMA

TX Frequency Range:	824.70 - 848.31 MHz Ch. 1013 (824.700 MHz) (low), Ch. 384 (836.52 MHz) (mid)& Ch. 777 (848.310 MHz) (high) measured unless otherwise noted
Software Power Gain Settings:	Set by manufacturer software or CDMA test set communications for "all ups"
Modulation Type(s):	QPSK

Applicant:	Itronix Corporation	Model:	IX260PNLA580BT	FCC ID:	KBCIX260PNLA580BT	IC ID:	1943A-IX260Pf
Rugged Laptop PC with Sierra Wireless AirCard 580 Dual-Band CDMA Modem and Cirronet BT2022 Bluetooth					<b>ITRONIX</b>		
2005 Celltech Labs Inc. This document is not to be reproduced in whole or in part without the written permission of Celltech Labs Inc.					13 of 51		

Test Report Serial No.:	022305KBC-T616-E24C/E15B Issue 1		
Test Date(s):		30Mar05 -	19Apr05
Test Type(s):	FCC §2, §15.247, §22H, §24E	IC RSS-210	/132/133
Lab Registration(s):	FCC #714830	IC Lab F	ile #3874

## 5.7.1.2 PCS CDMA

TX Frequency Range:         1851.25 - 1908.75 MHz           Ch. 25 (1851.25 MHz) (low), Ch 600 (1880 MHz) (mid) & Ch. 1175 (1908.75 (high) measured unless otherwise noted	
Software Power Gain Settings:	Set by manufacturer software or CDMA test set communications for "all ups"
Modulation Type(s):	QPSK

## 5.7.1.3 CDMA Modem Exercising Software Description

The DUT was configured and exercised during conducted testing using customer supplied test software, Directed Test Version 2.8, that allowed an operator to place the Dual-Band CDMA modem in an "all ups" mode. The modem manufacturer described this mode as one in which the modem transmitted at its maximum power level. For all radiated testing, the "all ups" mode was initiated with a call being connected with a CDMA test set through an antenna placed near the DUT.

### 5.7.2 Bluetooth Transmitter

Customer supplied software was used to set the Bluetooth transmitter to the appropriate channel and power level for the specific measurement. Measurements were made with the Bluetooth transmitter set to each of lowest, midband and highest channel or on the worst-case channel (78) for the measurement as required by the specific test. Worst-case co-transmitting conditions/channels were determined during prescan evaluations. The following settings where used for each channel.

TX Frequency Range:	2402 - 2480 MHz Ch. 0 (2402 MHz), Ch. 39 (2441 MHz) & Ch. 78 (2480 MHz) measured unless otherwise noted)
Software Power Gain Settings:	Ch. 0 - 220/45 Ch. 39 - 220/45 Ch. 78 - 220/45
Modulation Type(s):	GFSK 0.5 BT Gaussian
Modulation Frequency:	1000

### 5.7.3 Bluetooth Exercising Software Description

The DUT was configured and exercised using customer supplied Blue Core 01 test software that allowed an operator to set the parameters of the Bluetooth transmitter operation.

Lab Registration(s):	FCC #714830	IC Lab F	ile #3874	

## 5.8 Configuration Description

The DUT was configured, as described by the client as being representative of what would be delivered to a final customer. Because the swivel dipole antenna orientation could be user configured, prescan evaluations were made to determine the configuration that resulted in the highest spurious emissions. A "horizontal, pointing back" orientation was used for the both cellular and PCS bands. More specific details may be included in each appendix.

### 5.8.1 Configuration Justification

The DUT was tested in a configuration described by the client as being worst-case but typical of normal use. The system is available for use while installed in a vehicle cradle, utilizing a vehicle-mounted dipole antenna and the resulting measurements using this configuration were investigated and reported in the single transmitting report. Given that the vehicle antenna is a greater distance from the co-transmit antenna and has a lower dominant transmit power than the swivel dipole antenna, only the worst-case configuration using the swivel dipole antenna was used to investigate the co-transmission effects reported herein.

### 6.0 PASS/FAIL CRITERIA

Unless otherwise noted in the Appendices, the pass/fail criteria is the limit set forth in the reference standards. A DUT is considered to have passed the requirements, if the data collected during the described measurement procedure is within the specified limits as defined. The pass/fail statements made in this report only apply to the unit tested.

## Appendix B - CDMA Conducted RF Output Power Measurement

B.1. REFERENCES	
Normative Reference Standard	None*
Procedure Reference	ANSI/TIA/EIA-603-C, §2.1046(a)

*Used for refe	erence, no limit to apply. See Ap	pendix C and E for application of	of the ERP/EIRP limits.
The single transmit RF conducted	output power levels were reported	ed as follows:	
	Channel	Frequency	Peak Conducted Power
		MHz	dBm
	1013	824.70	+23.41
Cellular CDMA	384	836.52	+23.39
	777	848.31	+23.61
	25	1851.25	+24.41
PCS CDMA	600	1880.00	+25.07
	1175	1908.75	+24.62

\*This is presented as a reference to determine the effects the co-transmission the Bluetooth transmitter made to the output RF power of the CDMA modem.

\*ERP and EIRP limits are specified in Appendix C and E.

B.3. ENVIRONMENTAL CONDITIONS		
Temperature	25.2 +/- 2 °C	
Humidity	35 +/- 2 %	
Barometric Pressure	96.34 kPa

B.5. MEASUREMENT	EQUIPMENT SETUP
Measurement Equipment Connections	The equipment was connected as shown in the setup drawing in B.6.
Measurement Equipment Settings	Power Meter Settings: Mode - MAP Frequency compensation set for carrier frequency Offset set appropriately to compensate for any attenuator or cable losses
Measurement Procedure	The RF conducted power levels for both PCS and cellular bands were measured at the DUT antenna connector port using a Gigatronics 8652A Universal Power Meter in mean average power mode. An offset was entered into the power meter to correct for the losses of the attenuator and cable installed between the output port and the power sensor input. The DUT test software was used to set the CDMA to transmit in the CDMA "always up" power control mode and at the same time the Bluetooth transmitter was set to transmit at its max. power mode and channel.

Test Report Serial No.:	022305KBC-T616-E24C/E15B Issue 1		
Test Date(s):		30Mar05 -	19Apr05
Test Type(s):	FCC §2, §15.247, §22H, §24E	IC RSS-210	/132/133
Lab Registration(s):	FCC #714830	IC Lab F	ile #3874

#### **B.7. DUT OPERATING DESCRIPTION**

Power measurements were made of each channel in both the cellular and PCS bands, with the CDMA modem and Bluetooth transmitter set appropriately as described in section 5.7. An exception to this setup was that the Bluetooth transmitter mode was set for "TXData1" which transmitted a data string, rather than a 1000 Hz tone.

## B.8. TEST RESULTS

Mode	Channel	Frequency	Conducted Power
Cellular CDMA	1013	824.70 MHz	+23.32 dBm
	384	836.52 MHz	+23.38 dBm
	777	848.31 MHz	+23.58 dBm
PCS CDMA	25	1851.25 MHz	+24.40 dBm
	600	1880.00 MHz	+25.01 dBm
	1175	1908.75 MHz	+24.60 dBm

#### **B.9. PASS/FAIL**

There is no pass/fail criterion for this measurement. The ERP and EIRP levels applied to appropriate regulatory requirements are outlined in Appendix C and E. The most significant Cellular CDMA output power change was measured on Channel 1013, with the power dropping by 0.06 dB when the Bluetooth transmitter was set to transmit. The most significant PCS CDMA output power change was measured on Channel 600, with the power dropping by 0.09 dB when the Bluetooth transmitter was set to transmit on Channel 78.

### B.10. SIGN-OFF

I attest to the accuracy of the data. All measurements reported herein were performed by me and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements.

W. Pupe

### C.10. PASS/FAIL

In reference to the results outlined in C.9, the DUT passes the requirements as stated in the reference standards as follows:

A maximum ERP of 24.11 dBm (0.258 Watts) was measured when Channel 777 was co-transmitting with the Bluetooth.

## C.11. SIGN-OFF

I attest to the accuracy of the data. All measurements reported herein were performed by me and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements.

#### **D.8. DUT OPERATING DESCRIPTION**

Measurements were made for the Cellular CDMA Channel 1013 co-transmitting with Bluetooth Channel 78 (worst-case configuration) at their maximum power level as described in Section 5 of this report.

#### D.9. TEST RESULTS

The spurious measurements detailed in this section are referenced to the carrier levels set forth in Appendix C of this report:

D.9.1. Spurious Emissions

V	3	Horn SN6267	CH1013/CH78	4135.30	55.98						28.39*	na

Note: Intermod product field strength & theoretical margin presented for reference only.

Formulae:

Cel

ERP Level (dBm) = Power applied to Antenna (dBm) + Antenna Gain (dBd)

Margin (dB) = Limit (dBm) - Level (dBm)

\*The emissions reported above represent the highest emissions or noise floor measured at or near the inter-modulation product frequencies within the frequency band of 30MHz and the 10<sup>th</sup> harmonic of the carrier with field strengths within 20 dB of the theoretical limit. All other spurious emissions attributed to the EUT had field strengths greater than 20 dB below the theoretical limit or were presented in the single reports and substitutions were not made.

### D.10. PASS/FAIL

In reference to the results outlined in D.9, the DUT passes the requirements as stated in the reference standards.

FCC CFR 4 §22.917(e) Out of Band Emissions. The mean power of emissions must be attenuated below the mean power of the unmodulated carrier (P) on any frequency twice or more than twice the fundamental frequency by: at least 43 + 10 log P dB.

The results set forth in this section meet the requirement with a margin of at least 28.91 dB.

### D.11. SIGN-OFF

I attest to the accuracy of the data. All measurements reported herein were performed by me and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements.

#### F.8. DUT OPERATING DESCRIPTION

Measurements were made for the PCS CDMA Channel 25 co-transmitting with Bluetooth Channel 78 (worst-case configuration) at their maximum power level as described in Section 5 of this report.

#### F.9. TEST RESULTS

The spurious measurements detailed in this section are referenced to the carrier levels set forth in Appendix E of this report:

F.9.1. Spurious Emissions

Note: Intermod product field strength & theoretical margin presented for reference only.

Formulae:

**Ce**l

EIRP Level (dBm) = Power applied to Antenna (dBm) + Antenna Gain (dBi) Margin (dB) = Limit (dBm) - Level (dBm)

\*The emissions reported above represent the highest emissions or noise floor measured at or near the inter-modulation product frequencies within the frequency band of 30MHz and the 10<sup>th</sup> harmonic of the carrier with field strengths within 20 dB of the theoretical limit. All other spurious emissions attributed to the EUT had field strengths greater than 20 dB below the theoretical limit or were presented in the single reports and substitutions were not made.

#### F.10. PASS/FAIL

In reference to the results outlined in F.9, the DUT passes the requirements as stated in the reference standards.

FCC CFR 4 §24.238 (a) Out of band emissions. The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least 43 + 10 log(P) dB.

The results set forth in this section meet the requirement with a margin of at least 11.36 dB.

#### G.10. PASS/FAIL

In reference to the results outlined in G.9 the DUT passes the requirements as stated in the reference standards as follows:

FCC CFR 47§1.1310 Table 1(b) 1) The DUT must comply with the minimum spacing requirement of 20 cm to ensure an exposure of not more than f/1500 (0.57) mW/cm<sup>2</sup> for frequencies between 300 and 1500 MHz and 1 mW/cm<sup>2</sup> for frequencies between 1500 and 100,000 MHz.

The sum of the combined ratios for the Cellular CDMA co-transmitting with Bluetooth is 0.1653. The sum of the combined ratios for the PCS CDMA co-transmitting with Bluetooth is 0.1341.

#### G.11. SIGN-OFF

I attest to the accuracy of the data. All measurements reported herein were performed by me and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements.

H.5. MEASUREMENT	EQUIPMENT SETUP
Measurement Equipment Connections	The equipment was connected as shown in the setup drawing in I.6.
Measurement Equipment Settings	Power Meter Settings: Mode - MAP Frequency compensation set for carrier frequency Offset set appropriately to compensate for any attenuator or cable losses
Measurement Procedure	The Bluetooth transmitter RF conducted peak output power levels were measured at the DUT antenna connector port using a Gigatronics 8652A Universal Power Meter in mean average power mode. An offset was entered into the power meter to correct for the losses of the attenuator and cable installed between the output port and the power sensor input. The DUT test software was used to set the power and channel and at the same time the CDMA Modem was set to transmit at its max. power and channel for each band.

Test Report Serial No.:	022305KBC-T616	Issue 1	
Test Date(s):	30Mar05 - 19Apr05		
Test Type(s):	FCC §2, §15.247, §22H, §24E	IC RSS-210	/132/133
Lab Registration(s):	FCC #714830	IC Lab F	ile #3874

#### H.7. DUT OPERATING DESCRIPTION

Power measurements were made of each channel, with the CDMA modem and Bluetooth transmitter set appropriately as described in section 5.7 using the test software.

H.8. TEST RESULTS						
Mode	Channel	Frequency	Peak Conducted Power			
Co-transmitting with Channel 1013	0	2402 MHz	+15.41 dBm			
	38	2441 MHz	+15.27 dBm			
	79	2480 MHz	+14.85 dBm			
Co-transmitting with Channel 25	0	2402 MHz	+15.38 dBm			
	38	2441 MHz	+15.25 dBm			
	79	2480 MHz	+14.81 dBm			

#### H.9. PASS/FAIL

In reference to the results outlined in H.9, the DUT passes the requirements as stated in the reference standards as follows:

FCC 15.247 (b): The maximum peak output power of the intentional radiator shall not exceed the following:

(b) (3) For system using digital modulation in the 902 - 928 MHz, 2400 - 2483.5 MHz, and 5725 - 5850 MHz bands: <u>1 Watt.</u>

A maximum conducted RF power of +15.41 dBm (0.035 Watts) was measured when Channel 0 was co-transmitting with the Cellular CDMA Channel 1013. The most significant output power change was measured in this configuration, with the power dropping by 0.3 dB from that measured with the Bluetooth in a single-transmit state.

#### H.10. SIGN-OFF

I attest to the accuracy of the data. All measurements reported herein were performed by me and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements.
