Applicant Information

ITRONIX CORPORATION
801 South Stevens Street
Spokane, WA 99210
United States

FCC Rule Part(s):	**FCC 47 CFR §24(E), §22(H), §2**
IC Rule Part(s):	**RSS-133 Issue 2, RSS-132 Issue 1 (Provisional)**
Test Procedure(s):	**FCC 47 CFR §24(E), §22(H), §2**
	IC RSS-133 Issue 2, IC RSS-132 Issue 1 (Provisional)
	ANSI TIA/EIA-603-A-2001
FCC Device Classification:	**PCS Licensed Transmitter (PCB)**
IC Device Classification:	**2 GHz Personal Communication Services (RSS-133)**
	800 MHz Cellular Telephones Employing New Technologies (RSS-132)
Device Type:	**Rugged Laptop PC with Sony Ericsson GC82 Dual-Band GSM GPRS/EDGE PCMCIA Modem (co-located with Intel Pro 2200BG 802.11b/g WLAN & Internal Dual Surface-Mount Antennas) with External Swivel Dipole Antenna, Mobile Vehicle-Mount Antenna, & Vehicle Cradle**
FCC IDENTIFIER:	**KBCIX260PROGC82**
Model(s):	**IX260+**
Tx Frequency Range(s):	**1850.2 - 1909.8 MHz (PCS GSM)**
	824.2 - 848.8 MHz (Cellular GSM)
Rx Frequency Range(s):	**1930.2 - 1990.8 MHz (PCS GSM)**
	869.2 - 894.8 MHz (Cellular GSM)
Max. ERP/EIRP Measured:	**1.58 Watts EIRP - PCS GSM (Itronix Swivel Dipole Antenna Model: IX260+)**
	1.67 Watts ERP - Cellular GSM (Itronix Swivel Dipole Antenna Model: IX260+)
	0.311 Watts EIRP - PCS GSM (MaxRad Vehicle-Mount Antenna P/N: WMLPVDB800/1900)
	0.955 Watts ERP - Cellular GSM (MaxRad Vehicle-Mount Antenna P/N: WMLPVDB800/1900)
Max. Conducted Power Measured:	**30.13 dBm Peak (PCS GSM) / 32.27 dBm Peak (Cellular GSM)**
Mode(s) / Time Slot(s) Tested:	**GSM EDGE / 2-out-of-8 Time Slots (EDGE Max. Data Rate: 61.85 kbps per time slot)**
Source-Based Time-Av. Duty Cycle:	**25 %**
Source-Based Time-Av. Cond. Pwr:	**24.11 dBm Peak (Max. PCS GSM) / 26.25 dBm Peak (Max. Cellular GSM)**
Modulation Type(s):	**GMSK / 8-PSK**
Emission Designator(s):	**300KGXW**
Frequency Tolerance(s):	**0.0029 PPM (PCS GSM)**
	0.0055 PPM (Cellular GSM)
Antenna Type(s) Tested:	**Itronix IX260+ External Swivel Dipole (Dual-Band GSM)**
	MaxRad 3 dBi Gain Vehicle-Mount P/N: WMLPVDB800/1900 (Dual-Band GSM)
Power Source(s) Tested:	**11.1V Lithium-ion Battery, 6.0Ah (Model: A2121-2)**
	12V Vehicle Battery (for Vehicle Cradle)

This device has demonstrated compliance with the applicable technical standards as indicated in the measurement report and was tested in accordance with the measurement procedures specified in FCC 47 CFR §24(E), §22(H), §2; Industry Canada RSS-133 Issue 2, RSS-132 Issue 1 (Provisional); and ANSI TIA/EIA-603-A-2001.

I attest to the accuracy of data. All measurements reported herein were performed by me or were made under my supervision and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements and vouch for the qualifications of all persons taking them.

Russell Pipe
Senior Compliance Technologist

TABLE OF CONTENTS

FCC PART 24(E) & 22(H) EMC MEASUREMENT REPORT

1.1 SCOPE

Measurement and determination of electromagnetic emissions (EME) from radio frequency devices for compliance with the technical rules and regulations of the Federal Communications Commission and Industry Canada.

2.1 GENERAL INFORMATION - §2.1033(a)

APPLICANT	**ITRONIX CORPORATION**			**801 South Stevens Street Spokane, WA 99210**				
FCC IDENTIFIER	KBCIX260PROGC82							
Model(s)	IX260+							
Serial No.	ZZGEG4112ZZ9777			Production Unit				
Device Type	Rugged Laptop PC with Sony Ericsson GC82 Dual-Band GSM GPRS/EDGE PCMCIA Modem (co-located with Intel Pro 2200BG 802.11b/g WLAN & Internal Dual Surface-Mount Antennas) with External Swivel Dipole Antenna, Vehicle-Mount Antenna, & Vehicle Cradle							
FCC Rule Part(s)	§24(E)			§22(H)			§2	
IC Rule Part(s)	RSS-133 Issue 2			RSS-132 Issue 1 (Provisional)				
FCC Classification	PCS Licensed Transmitter (PCB)							
IC Classification	2 GHz Personal Communication Services (RSS-133)							
	800 MHz Cellular Telephones Employing New Technologies (RSS-132)							
Tx Frequency Range(s)	1850.2 - 1909.8 MHz			PCS GSM				
	824.2 - 848.8 MHz			Cellular GSM				
Rx Frequency Range(s)	1930.2 - 1990.8 MHz			PCS GSM				
	869.2 - 894.8 MHz			Cellular GSM				
Antenna Type(s) Tested	Type	Description		Max. RF Output Power (EIRP/ERP)				Length
	GSM	External Swivel Dipole		1.58	W	EIRP	PCS	4.7 "
				1.67	W	ERP	Cellular	
	GSM	3 dBi Gain Mobile Vehicle-Mount		0.311	W	EIRP	PCS	2.7 "
				0.955	W	ERP	Cellular	
Transmit Type	Individual Transmit Only (co-located transmitters do not transmit simultaneously)							
Max. RF Conducted Output Power Tested	30.13 dBm		Peak	PCS GSM				
	32.27 dBm		Peak	Cellular GSM				
Modes / Data Rates Tested	PCS/Cellular GSM EDGE		2-out-of-8 Time Slots		25% Duty Cycle		61.85 kbps (max.)	
Source-Based Time-Averaged Conducted Power Tested	24.11 dBm Peak (Max. PCS GSM)			26.25 dBm Peak (Max. Cellular GSM)				
Emission Designator(s)	300KGXW							
Frequency Tolerance	0.0029 PPM (PCS GSM)			0.0055 PPM (Cellular GSM)				
Modulation Type(s)	GMSK / 8-PSK							
Power Source(s) Tested	Lithium-ion Battery		11.1V, 6.0Ah			Model: A2121-2		
	Vehicle Battery		12V			For Vehicle Cradle		

MEASUREMENT PROCEDURES

3.1 RF OUTPUT POWER MEASUREMENT - §2.1046

The peak conducted power levels for both PCS and cellular bands were measured at the GC82 PCMCIA Modem using a Gigatronics 8652A Universal Power Meter in burst average power mode. An offset was entered into the power meter to correct for the losses of the attenuator and cable installed between the transmitter output port and the power sensor input. The Sony Ericsson GC82 test software was used to set the DUT to transmit in the GSM EDGE mode, at maximum rated power and at a worse case data rate and timeslot allocation, as defined by the manufacturer. All subsequent tests were performed using the same power measurement procedures.

RF CONDUCTED OUTPUT POWER MEASUREMENTS AT GC82 PCMCIA MODEM			
Frequency (MHz)	**Peak Power (dBm)**	**Frequency (MHz)**	**Peak Power (dBm)**
824.2	32.25	**1850.2**	29.73
836.6	32.21	**1880.0**	30.13
848.8	32.27	**1909.8**	29.84

4.1 EFFECTIVE ISOTROPIC RADIATED POWER OUTPUT - §24.232(b)

EIRP measurements were performed on a 3-meter open area test site using the Signal Substitution Method in accordance with ANSI TIA/EIA-603-A-2001. The Sony Ericsson GC82 test software installed in the Laptop PC was used to set the DUT to transmit in the GSM EDGE mode at maximum rated power and at a worse case data rate and timeslot allocation, as defined by the manufacturer. The DUT was placed on a turntable 3 meters from the receive antenna. For the swivel dipole evaluation, the DUT was placed in the center of the turntable, on a Styrofoam support, 1 meter above the ground plane. For the vehicle-mount antenna evaluation, the antenna was fixed on a 50 cm x 50 cm ground plane and installed on the Styrofoam support, and connected to the transmitter via a 17-foot LMR-195 cable representing a typical vehicle mount installation. The Laptop PC was installed in the cradle on the turntable below the 50 cm x 50 cm ground plane. The maximum field intensity was determined by rotating the DUT approximately 360 degrees and changing the height of the receive antenna from 1 to 4 meters. Once the maximum emission was found, the spectrum analyzer was set to peak hold and the uncorrected emission value recorded for each of the low, mid and high channels tested. The DUT was then substituted with a horn antenna. A signal, simulating the DUT emission was generated, amplified, and fed through a directional coupler to the substitution antenna. The height and direction of the receive antenna as well as the direction of the substitution horn was adjusted for a maximum received signal. The power applied to the horn was then adjusted to give the same field strength reading as previously recorded for the DUT and the power at the forward coupler port recorded. The substitution antenna was then replaced with a calibrated power sensor, the forward coupler port power level confirmed and the power applied to the horn antenna recorded. The EIRP level was determined by correcting the applied feed point power with the addition of the horn gain. The test data is shown on page 6.

5.1 EFFECTIVE RADIATED POWER OUTPUT - §22.913

ERP measurements were performed on a 3-meter open area test site using the Signal Substitution Method in accordance with ANSI TIA/EIA-603-A-2001. The Sony Ericsson GC82 test software installed in the Laptop PC was used to set the DUT to transmit in the GSM EDGE mode, at maximum rated power and at a worse case data rate and timeslot allocation, as defined by the manufacturer. The DUT was placed on a turntable, 3 meters from the receive antenna. For the swivel dipole testing, the DUT was placed in the center of the turntable, on a Styrofoam support, 1 meter above the ground plane. For the vehicle-mount antenna evaluation, the antenna was fixed on a 50 cm x 50 cm ground plane and installed on the Styrofoam support and connected to the transmitter via a 17-foot LMR-195 cable representing a typical vehicle mount installation. The Laptop PC was installed in the cradle on the turntable below the 50 cm x 50 cm ground plane. The maximum field intensity was determined by rotating the DUT approximately 360 degrees and changing the height of the receive antenna from 1 to 4 meters. Once the maximum emission was found, the spectrum analyzer was set to peak hold and the uncorrected emission value recorded for each of the low, mid and high channels tested. The DUT was then substituted with a dipole antenna. A signal, simulating the DUT emission was generated, amplified, and fed through a directional coupler to the substitution antenna. The height and direction of the receive antenna as well as the direction of the substitution dipole was adjusted for a maximum received signal. The power applied to the dipole was then adjusted to give the same field strength reading as previously recorded for the DUT and the power at the forward coupler port recorded. The substitution antenna was then replaced with a calibrated power sensor, the forward coupler port power level confirmed and the power applied to the dipole antenna recorded. The ERP level was determined by correcting the applied feed point power with the addition of the dipole gain. The test data is shown on page 7.

MEASUREMENT PROCEDURES (Cont.)

6.1 FIELD STRENGTH OF SPURIOUS RADIATION - §24.238; 22.917

EIRP measurements were performed on a 3-meter open area test site using the Signal Substitution Method in accordance with ANSI TIA/EIA-603-A-2001. The Sony Ericsson GC82 test software installed in the Laptop PC was used to set the DUT to transmit in the GSM EDGE mode, at maximum rated power and at a worse case data rate and timeslot allocation, as defined by the manufacturer. For the swivel dipole testing, the DUT was placed in the center of the turntable, on a Styrofoam support, 1 meter above the ground plane. For the vehicle-mount antenna evaluation, the antenna was fixed on a 50 cm x 50 cm ground plane and installed on the Styrofoam support and connected to the transmitter via a 17-foot LMR-195 cable representing a typical vehicle mount installation. The Laptop PC was installed in the cradle on the turntable below the 50 cm x 50 cm ground plane. A frequency band from just above the highest transmitted frequency to just above the 10th harmonic of the highest transmitted frequency was divided into smaller bands corresponding to measurement equipment setups and capabilities. The measurement equipment including carrier blocking filters, was optimized for maximum sensitivity for each band while ensuring no saturation occurred in any gain stages that may be present. It was also necessary to measure the bands above 10 GHz at a distance of 1 meter versus the 3-meter measurement distance used for the lower bands. The applicable bands were chosen from: 800 MHz to 1 GHz, 1 GHz to 5 GHz, 5 GHz to 10 GHz, 10 GHz to 18 GHz and 18 GHz to 20 GHz. The maximum field intensity in each of these bands were determined by rotating the DUT approximately 360 degrees and changing the height of the receive antenna from 1 to 4 meters while maintaining the spectrum analyzer trace in max hold. The stored trace was then evaluated to determine any significant emissions that should be evaluated by substitution. The frequency and uncorrected field strength level for each significant emission was recorded. To describe the noise floor, the maximum level associated with a number of frequencies within the band were also recorded. The DUT was then substituted with a transmit antenna. A signal simulating the DUT emission was generated for each of the signals recorded; it was amplified and fed through a directional coupler to the substitution antenna. The height and direction of the receive antenna as well as the direction of the substitution horn was adjusted for a maximum received signal. The power applied to the transmit antenna was then adjusted to give the same field strength reading as previously recorded for the DUT and the power at the forward coupler port recorded. The substitution antenna was then replaced with a calibrated power sensor, the forward coupler port power level confirmed and the power applied to the horn antenna recorded. The radiated power level was determined by correcting the applied feed point power with the addition of the antenna gain. The test data is shown on page 8-13.

12.1 SUMMARY

The data in this measurement report demonstrates that the ITRONIX CORPORATION Model: IX260+ Rugged Laptop PC FCC ID: KBCIX260PROGC82 with Sony Ericsson GC82 Dual-Band PCS/Cellular GSM GPRS/EDGE PCMCIA Radio Modem with external swivel dipole antenna and mobile vehicle-mount antenna (co-located with Intel Pro 2200BG 802.11b/g WLAN Mini-PCI Card and internal dual surface-mount antennas) complies with the requirements of FCC §24(E), §22(H), and §2.
