Modifications made to the product See the Modifications section of this report

Test Facility

The measurement facility used to collect the data is located at:

Northwest EMC, Inc. 22975 NW Evergreen Parkway, Suite 400; Hillsboro, OR 97124 Phone: (503) 844-4066 Fax: 844-3826

This site has been fully described in a report filed with and accepted by the FCC (Federal Communications Commission) and Industry Canada.

| Approved By: |
|-------------------------|
| Donald Marteau |
| Don Facteau, IS Manager |

This report must not be used to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the federal government of the United States of America.

Product compliance is the responsibility of the client, therefore the tests and equipment modes of operation represented in this report were agreed upon by the client, prior to testing. This Report may only be duplicated in its entirety. The results of this test pertain only to the sample(s) tested, the specific description is noted in each of the individual sections of the test report supporting this certificate of test.

| Revision Number | Description | Date | Page Number |
|--------------------|-------------|------|-------------|
| | | | |
| 00 | None | | |

FCC: Accredited by NVLAP for performance of FCC radio, digital, and ISM device testing. Our Open Area Test Sites, certification chambers, and conducted measurement facilities have been fully described in reports filed with the FCC and accepted by the FCC in letters maintained in our files. Northwest EMC has been accredited by ANSI to ISO / IEC Guide 65 as a product certifier. We have been designated by the FCC as a Telecommunications Certification Body (TCB). This allows Northwest EMC to certify transmitters to FCC specifications in accordance with 47 CFR 2.960 and 2.962.

NVLAP: Northwest EMC, Inc. is recognized under the United States Department of Commerce, National Institute of Standards and Technology, and National Voluntary Laboratory Accreditation Program for satisfactory compliance with the requirements of ISO/IEC 17025 for Testing Laboratories. The NVLAP accreditation encompasses Electromagnetic Compatibility Testing in accordance with the European Union EMC Directive 89/336/EEC, ANSI C63.4, MIL-STD 461E, DO-160D and SAE J1113. Additionally, Northwest EMC is accredited by NVLAP to perform radio testing in accordance with the European Union R&TTE Directive 1999/5/EEC, the requirements of FCC, and the RSS radio standards for Industry Canada.

Industry Canada: Accredited by NVLAP for performance of Industry Canada RSS and ICES testing. Our Open Area Test Sites and certification chambers comply with RSS 212, Issue 1 (Provisional) and have been filed with Industry Canada and accepted. Northwest EMC has been accredited by ANSI to ISO / IEC Guide 65 as a product certifier. We have been designated by NIST and recognized by Industry Canada as a Certification Body (CB) per the APEC Mutual Recognition Arrangement (MRA). This allows Northwest EMC to certify transmitters to Industry Canada technical requirements.

CAB: Designated by NIST and validated by the European Commission as a Conformity Assessment Body (CAB) to conduct tests and approve products to the EMC directive and transmitters to the R&TTE directive, as described in the U.S. - EU Mutual Recognition Agreement.

TÜV Product Service: Included in TUV Product Service Group's Listing of Recognized Laboratories. It qualifies in connection with the TUV Certification after Recognition of Agent's Testing Program for the product categories and/or standards shown in TUV's current Listing of CARAT Laboratories, available from TUV. A certificate was issued to represent that this laboratory continues to meet TUV's CARAT Program requirements. Certificate No. USA0401C.

TÜV Rheinland: Authorized to carryout EMC tests by order and under supervision of TÜV Rheinland. This authorization is based on "Conditions for EMC-Subcontractors" of November 1992.

200630-0

200676-0

NEMKO: Assessed and accredited by NEMKO (Norwegian testing and certification body) for European emissions and immunity testing. As a result of NEMKO's laboratory assessment, they will accept test results from Northwest EMC, Inc. for product certification (Authorization No. ELA 119).

Technology International: Assessed in accordance with ISO Guide 25 defining the general international requirements for the competence of calibration and testing laboratories and with ITI assessment criteria LACO196. Based upon that assessment, Interference Technology International, Ltd., has granted approval for specifications implementing the EU Directive on EMC (89/336/EEC and amendments). The scope of the approval was provided on a Schedule of Assessment supplied with the certificate and is available upon request.

Australia/New Zealand: The National Association of Testing Authorities (NATA), Australia has been appointed by the ACA as an accreditation body to accredit test laboratories and competent bodies for EMC standards. Accredited test reports or assessments by competent bodies must carry the NATA logo. Test reports made by an overseas laboratory that has been accredited for the relevant standards by an overseas accreditation body that has a Mutual Recognition Agreement (MRA) with NATA are also accepted as technical grounds for product conformity. The report should be endorsed with the respective logo of the accreditation body (NVLAP).

VCCI: Accepted as an Associate Member to the VCCI, Acceptance No. 564. Conducted and radiated measurement facilities have been registered in accordance with Regulations for Voluntary Control Measures, Article 8. (Registration Numbers. - Hillsboro: C-1071 and R-1025, Irvine: C-2094 and R-1943, Newberg: C-1877 and R-1760, Sultan: R-871, C-1784 and R-1761).

BSMI: Northwest EMC has been designated by NIST and validated by C-Taipei (BSMI) as a CAB to conduct tests as described in the APEC Mutual Recognition Agreement. License No.SL2-IN-E-1017.

GOST: Northwest EMC, Inc. has been assessed and accredited by the Russian Certification bodies Certinform VNIINMASH, CERTINFO, SAMTES, and Federal CHEC, to perform EMC and Hygienic testing for Information Technology Products. As a result of their laboratory assessment, they will accept test results from Northwest EMC, Inc. for product certification

> SCOPE For details on the Scopes of our Accreditations, please visit: http://www.nwemc.com/scope.asp

BSMI

Revision 03/18/05

NEMKO

What is measurement uncertainty?

When a measurement is made, the result will be different from the true or theoretically correct value. The difference is the result of tolerances in the measurement system that cannot be completely eliminated. To the extent that technology allows us, it has been our aim to minimize this error. The following statement of measurement uncertainty is used to reflect the accuracy of the measured result as compared with its "true" value. In the case of transient tests (ESD, EFT, Surge, Voltage Dips and Interruptions), the test equipment has been demonstrated by calibration to provide at least a 95% confidence that it complies with the test specification requirements.

The following documents were the basis for determining the uncertainty levels of our measurements:

- "ISO Guide to the Expression of Uncertainty in Measurements", October 1993
- "NIS81: The Treatment of Uncertainty in EMC Measurements", May 1994
- "IEC CISPR 16-3 A1 f1 Ed.1: Radio-interference measurements and statistical techniques", December 2000

How might measurement uncertainty be applied to test results?

If the diamond marks the measured value for the test and the vertical bars bracket the range of + and measurement uncertainty, then test results can be interpreted from the diagram below.

Case D: Product does not comply.

| Radiated Emissions ≤ 1 GHz | | Value (| dB) | | | | |
|-------------------------------------|--------------|---------|--------|--------|---------|--------|--------|
| | Probability | Bico | nical | Log Pe | eriodic | Di | pole |
| | Distribution | Ante | enna | Ante | nna | An | tenna |
| Test Distance | | 3m | 10m | 3m | 10m | 3m | 10m |
| Combined standard | normal | + 1.86 | + 1.82 | + 2.23 | + 1.29 | + 1.31 | + 1.25 |
| uncertainty <i>u_c(y)</i> | | - 1.88 | - 1.87 | - 1.41 | - 1.26 | - 1.27 | - 1.25 |
| Expanded uncertainty U | normal (k=2) | + 3.72 | + 3.64 | + 4.46 | + 2.59 | + 2.61 | + 2.49 |
| (level of confidence \approx 95%) | | - 3.77 | - 3.73 | -2.81 | - 2.52 | - 2.55 | - 2.49 |

| Radiated Emissions > 1 GHz | Value (dB) | | |
|---|--------------|--------------|-------------|
| | Probability | Without High | With High |
| | Distribution | Pass Filter | Pass Filter |
| Combined standard uncertainty <i>u_c(y)</i> | normal | + 1.29 | + 1.38 |
| | | - 1.25 | - 1.35 |
| Expanded uncertainty U | normal (k=2) | + 2.57 | + 2.76 |
| (level of confidence \approx 95%) | | - 2.51 | 2.70 |

| Conducted Emissions | | |
|---|----------------|----------|
| | Probability | Value |
| | Distribution | (+/- dB) |
| Combined standard uncertainty <i>uc(y)</i> | normal | 1.48 |
| Expanded uncertainty U (level of confidence ≈ 95 %) | normal (k = 2) | 2.97 |

| Radiated Immunity | | |
|--|--|----------|
| | Probability | Value |
| | Distribution | (+/- dB) |
| Combined standard uncertainty <i>uc(y)</i> | normal | 1.05 |
| Expanded uncertainty U | normal $(k - 2)$ | 2 11 |
| (level of confidence \approx 95 %) | $\operatorname{Hormal}\left(R=2\right)$ | 2.11 |

| Conducted Immunity | | |
|---|----------------|----------|
| | Probability | Value |
| | Distribution | (+/- dB) |
| Combined standard uncertainty <i>uc(y</i>) | normal | 1.05 |
| Expanded uncertainty U (level of confidence ≈ 95 %) | normal (k = 2) | 2.10 |

Legend

 $u_c(y)$ = square root of the sum of squares of the individual standard uncertainties

U = combined standard uncertainty multiplied by the coverage factor: **k**. This defines an interval about the measured result that will encompass the true value with a confidence level of approximately 95%. If a higher level of confidence is required, then k=3 (CL of 99.7%) can be used. Please note that with a coverage factor of one, uc(y) yields a confidence level of only 68%.

Product Description

| Party Requesting the Test | | |
|---------------------------|------------------------------|--|
| Company Name: | Spectrum Technology | |
| Address: | 209 Dayton Street Suite #205 | |
| City, State, Zip: | dmonds, WA 98020 | |
| Test Requested By: | Rod Munro | |
| Model: | MC75 | |
| First Date of Test: | 07-26-2005 | |
| Last Date of Test: | 07-29-2005 | |
| Receipt Date of Samples: | 07-26-2005 | |
| Equipment Design Stage: | Production | |
| Equipment Condition: | No visual damage. | |

Information Provided by the Party Requesting the Test

| Clocks/Oscillators: | Not provided. |
|---------------------|---------------|
| I/O Ports: | Not Provided. |

Functional Description of the EUT (Equipment Under Test):

GSM Modem for use in IX600 ruggedized laptop. The MC75 is a Quad band GSM/GPRS/EGPRS module subject to Part 22H and 24E.

Client Justification for EUT Selection:

The product is an engineering sample, representative of the final product.

Client Justification for Test Selection:

These tests satisfy the requirements of FCC part 22H and part 24E.

Modifications

| | Equipment modifications | | | | |
|------|-------------------------------------|------------|--|--|--------------------------------------|
| Item | Test | Date | Modification | Note | Disposition of EUT |
| 1 | Spurious Radiated Emissions | 07/26/2005 | No EMI suppression devices were added or modified during this test. | Same configuration as delivered. Testing two different configurations – Vehicular Mount and Laptop only. | EUT remained at Northwest EMC. |
| 2 | Spurious Radiated Emissions | 07/27/2005 | No EMI suppression devices were added or modified during this test. | Same configuration as delivered. Testing two different configurations – Vehicular Mount and Laptop only. | EUT remained at Northwest EMC. |
| 3 | Spurious Radiated Emissions | 07/28/2005 | No EMI suppression devices were added or modified during this test. | Same configuration as delivered. Testing two different configurations – Vehicular Mount and Laptop only. | EUT remained at Northwest EMC. |
| 4 | Field Strength of Fundamental | 07/28/2005 | No EMI suppression devices were added or modified during this test. | Same configuration as delivered. Testing two different configurations – Vehicular Mount and Laptop only. Replaced laptop/radio module. Old radio card was malfunctioning. | EUT remained at Northwest EMC. |
| 5 | Radiated Emissions | 07/29/2005 | No EMI suppression devices were added or modified during this test. | Same configuration as in previous test. | EUT remained at Northwest EMC. |
| 6 | Conducted Emissions | 07/29/2005 | No EMI suppression devices were added or modified during this test. | Same configuration as in previous test. | EUT remained at Northwest EMC. |

The individuals and/or the organization requesting the test provided the modes, configurations and settings available to evaluate. All of the EUT parameters listed below were investigated. This includes, but may not be limited to, CPU speeds, video resolution settings, operational modes, and input voltages.

| Operating Modes Investigated: |
|-------------------------------------|
| Receive mode – Cellular Band |
| Operating Mode used for Final Test: |
| Receive mode – Cellular Band |

| Power Input Settings Investigated: |
|--|
| 120 VAC, 60 Hz |
| Input Power Setting used for Final Test: |
| 120 VAC, 60 Hz |

| Frequency Range Investigated | | | |
|------------------------------|--------|----------------|-------|
| Start Frequency | 30 MHz | Stop Frequency | 5 GHz |

| Other Settings Inve | estigated: |
|---------------------|--|
| Configuration 1 | GSM Radio in Laptop |
| Configuration 2 | GSM Radio in Laptop with Laptop Docked in Vehicular Mount using External Radio |

| Software\Firmware Applied During Test | | | | |
|--|---------------|---------|-----|--|
| Exorging coffware | Microsoft® | Version | 5 1 | |
| Exercise software | HyperTerminal | Version | 5.1 | |
| Description | | | | |
| The system was tested using hyperterminal software on a remote pc to access the EUT during the | | | | |
| testing. A call was originated by the wireless communications test set and answered via hyperterminal on | | | | |
| the EUT. | | | | |

The final radiated emissions test was performed using the parameters described above as worst case. That final test was conducted at a facility that meets the ANSI C63.4 NSA requirements. The frequency range noted in the data sheets was scanned/tested at that facility. Emissions were maximized as specified, by maximizing table azimuth, antenna height, and cable manipulation.

Using the mode of operation and configuration noted within this report, a final radiated emissions test was performed. The frequency range investigated (scanned), is also noted in this report. Radiated emissions measurements were made at the EUT azimuth and antenna height such that the maximum radiated emissions level will be detected. This requires the use of a turntable and an antenna positioner. The preferred method of a continuous azimuth search is utilized for frequency scans of the EUT field strength with both polarities of the measuring antenna. A calibrated, linearly polarized antenna was positioned at the specified distance from the periphery of the EUT.

Note: The specified distance is the horizontal separation between the closest periphery of the EUT and the center of the axis of the elements of the receiving antenna. However, if the receiving antenna is a log-periodic array, the specified distance shall be the distance between the closest periphery of the EUT and the front-to-back center of the array of elements.

Tests were made with the antenna positioned in both the horizontal and vertical planes of polarization. The measurement was varied in height above the conducting ground plane to obtain the maximum signal strength. Though specified in the report, the measurement distance shall be 1 meter, 3 meters, 5 meters, 10 meters, or 30 meters. At any measurement distance, the antenna height was varied from 1 meter to 4 meters. These height scans apply for both horizontal and vertical polarization, except that for vertical polarization the minimum height of the center of the antenna shall be increased so that the lowest point of the bottom of the antenna clears the ground surface by at least 25 cm.

| Measurement Bandwidths | | | | |
|--|--------------------|--------------------------|-----------------------|--|
| Frequency Range (MHz) | Peak Data (kHz) | Quasi-Peak Data (kHz) | Average Data (kHz) | |
| 0.01 - 0.15 | 1.0 | 0.2 | 0.2 | |
| 0.15 - 30.0 | 10.0 | 9.0 | 9.0 | |
| 30.0 - 1000 | 100.0 | 120.0 | 120.0 | |
| Above 1000 | 1000.0 | N/A | 1000.0 | |
| Measurements were made using the bandwidths and detectors specified. No video filter was used. | | | | |

The individuals and/or the organization requesting the test provided the modes, configurations and settings available to evaluate. All of the EUT parameters listed below were investigated. This includes, but may not be limited to, CPU speeds, video resolution settings, operational modes, and input voltages.

Operating Modes Investigated:

Receive mode – Cellular Band

Power Input Settings Investigated:

120 VAC, 60 Hz

Using the mode of operation and configuration noted within this report, conducted emissions tests were performed. The frequency range investigated (scanned), is also noted in this report. Conducted power line measurements are made, unless otherwise specified, over the frequency range from 150 kHz to 30 MHz to determine the line-to-ground radio-noise voltage that is conducted from the EUT power-input terminals that are directly (or indirectly via separate transformer or power supplies) connected to a public power network. Equipment is tested with power cords that are normally used or that have electrical or shielding characteristics that are the same as those cords normally used. Typically those measurements are made using a LISN (Line Impedance Stabilization Network), the 50 Ω measuring port is terminated by 50 Ω .

| Measurement Bandwidths | | | | | | |
|--|--------------------|--------------------------|-----------------------|--|--|--|
| Frequency Range (MHz) | Peak Data (kHz) | Quasi-Peak Data (kHz) | Average Data (kHz) | | | |
| 0.01 - 0.15 | 1.0 | 0.2 | 0.2 | | | |
| 0.15 – 30.0 | 10.0 | 9.0 | 9.0 | | | |
| 30.0 - 1000 | 100.0 | 120.0 | 120.0 | | | |
| Above 1000 | 1000.0 | N/A | 1000.0 | | | |
| Measurements were made using the bandwidths and detectors specified. No video filter was used. | | | | | | |

The individuals and/or the organization requesting the test provided the modes, configurations and settings available to evaluate. While scanning the radiated emissions, all of the EUT parameters listed below were investigated. This includes, but may not be limited to, antennas, tuned transmit frequency ranges, operating modes, and data rates.

| Channels in Specified Band Investigated: |
|--|
| GSM PCS Low Ch. 512 = 1850.2 MHz |
| GSM PCS Mid Ch. 661 = 1880 MHz |
| GSM PCS High Ch. 810 = 1909.8 MHz |
| GSM Cellular Low Ch. 128 = 824.2 MHz |
| GSM Cellular Mid Ch. 190 = 836.6 MHz |
| GSM Cellular High Ch. 251 = 848.8 MHz |

Requirement: The applicable limits are 22.913(a) for the cellular band, and 24.238(a) for the PCS band.

Per 22.913(a), the power for mobile and auxiliary transmitters must be less than 7 Watts ERP.

Per 24.232(b), the power for mobile and portable transmitters must be less than 2 Watts EIRP.

<u>Configuration</u>: The highest gain of each type of antenna to be used with the EUT was tested. The EUT was configured for low, mid, and high band transmit frequencies. For each configuration, the fundamental emission from the EUT were maximized by rotating the EUT on a turntable, adjusting the position of the EUT and EUT antenna in three orthogonal axis, and adjusting the measurement antenna height and polarization.

Test Methodology: For licensed transmitters, the FCC references ANSI/TIA-603-B as the measurement procedure standard. ANSI/TIA-603-B Section 2.2.12 describes a method for measuring radiated emissions that utilizes an antenna substitution method:

At an approved test site, the transmitter is place on a remotely controlled turntable, and the measurement antenna is placed 3 meters from the transmitter. The turntable azimuth is varied to maximize the level of emissions. The height of the measurement antenna is also varied from 1 to 4 meters. The amplitude and frequency of the highest emissions are noted. The transmitter is then replaced with a ½ wave dipole that is successively tuned to each of the highest emissions. A signal generator is connected to the dipole (horn antenna for frequency. The output of the signal generator is recorded, and by factoring in the cable loss to the dipole antenna and its gain; the power (ERP or e.i.r.p) is determined for each radiated emission.

The individuals and/or the organization requesting the test provided the modes, configurations and settings available to evaluate. While scanning the radiated emissions, all of the EUT parameters listed below were investigated. This includes, but may not be limited to, antennas, tuned transmit frequency ranges, operating modes, and data rates.

| Channels in Specified Band Investigated: |
|--|
| GSM PCS Low Ch. 512 = 1850.2 MHz |
| GSM PCS Mid Ch. 661 = 1880 MHz |
| GSM PCS High Ch. 810 = 1909.8 MHz |
| GSM Cellular Low Ch. 128 = 824.2 MHz |
| GSM Cellular Mid Ch. 190 = 836.6 MHz |
| GSM Cellular High Ch. 251 = 848.8 MHz |

Operating Modes Investigated:

Typical

Data Rates Investigated:

Maximum

Power Input Settings Investigated: 120 VAC, 60 Hz.

<u>Requirement</u>: Per 2.1053, the field strength of spurious radiation was measured in the far-field at an FCC Listed semi-anechoic chamber up to 25 GHZ. The applicable limits are 22.917(a) for the cellular band, and 24.238(a) for the PCS band.

Per 22.917(a), The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least 43 + 10 log(P) dB (-13 dBm).

Per 24.238(a), The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least 43 + 10 log(P) dB (-13 dBm).

<u>Configuration</u>: The highest gain of each type of antenna to be used with the EUT was tested. The EUT was configured for low, mid, and high band transmit frequencies. For each configuration, the spectrum was scanned throughout the specified range. While scanning, emissions from the EUT were maximized by rotating the EUT on a turntable, adjusting the position of the EUT and EUT antenna in three orthogonal axis, and adjusting the measurement antenna height and polarization. A preamp and high pass filter were used for this test in order to provide sufficient measurement sensitivity.

Test Methodology: For licensed transmitters, the FCC references ANSI/TIA-603-B as the measurement procedure standard. ANSI/TIA-603-B Section 2.2.12 describes a method for measuring radiated emissions that utilizes an antenna substitution method:

At an approved test site, the transmitter is place on a remotely controlled turntable, and the measurement antenna is placed 3 meters from the transmitter. The turntable azimuth is varied to maximize the level of emissions. The height of the measurement antenna is also varied from 1 to 4 meters. The amplitude and frequency of the highest emissions are noted. The transmitter is then replaced with a ½ wave dipole that is successively tuned to each of the highest emissions. A signal generator is connected to the dipole (horn antenna for frequency. The output of the signal generator is recorded, and by factoring in the cable loss to the dipole antenna and its gain; the power (ERP or e.i.r.p) is determined for each radiated emission.
