1) The transmitted signal is a series of code via on-off keying modulation.
The this code has been confirmed in the Rx, action is taken.

2) If you enjoy sailing, you will prefer to own a boat and sailing on the lake during your vactation. If unfortunately, you are not living around lake, then you need to drive your car and drag your boat behind your car to the lake area.

But it is very dangerous for the driver behind you if you drag a boat, because they could not see the brake light of your car.

The Rx of this product has to be installed on the back of your boat, and the Tx is in your car and activated by the brake of your car. So, when you brake during driving, the Tx will transmit signal to the Rx installed on the end of the boat you drag.

The light of the Rx will flash, which can warn the driver of the car behind you that you are braking the car now.

Best Regards,
