SECURITY HANDHELD METAL DETECTOR
MATRIX™

Matrix™ 100

INSTRUCTION MANUAL

Introduction

The Matrix 100 Handheld Metal Detector is a world class security scanner. It is designed to meet and exceed the needs and specifications of today's security conscious world, and complies with all National Institute of Justice standards for indoor/outdoor operations. "Made in the U.S.A." is a hallmark of White's Electronics, the Matrix 100 utilizes the latest in electronic design technology that is both functional and attractive.
The Matrix 100 Handheld Metal Detector is designed to detect metal and is primarily for security applications, however it is useful for a myriad of detection applications.

There are three selections for the ON/OFF button:
- ON Audio
- ON Vibrate
- OFF

ON Audio—press the ON/OFF button once. This will be followed by a single, double, or triple beep to indicate the current sensitivity level setting. The green ON indicator LED will emit a single flash for low sensitivity, double flash for medium sensitivity or a triple flash for high sensitivity.

ON Vibrate—press the ON/OFF button twice. This will be followed by a single vibration burst and the ON indicator LED will emit a single flash for low sensitivity, double flash for medium sensitivity, or a triple flash for high sensitivity. The audio alarm is deactivated when the vibrate alarm is activated.

OFF—Turn the unit off by pressing the ON/OFF button once. The ON indicator LED will disappear.

ON/OFF button

Speaker

Earbud jack
The unit is preset, at the factory, to medium sensitivity. The sensitivity level can be changed to the low, medium, or high level.* The Specifications List (see Page 20) shows the effect of the different sensitivity levels for detecting objects of various sizes.

To change the sensitivity level, open the battery door and remove the stylus (see Page 7). Use the stylus to press the sensitivity control to cycle through the sensitivity levels,(low, medium, or high). The unit will beep or vibrate and will flash the red visual indicator LED to announce the new sensitivity level:

One beep/vibration/flash = low sensitivity
Two beeps/vibrations/flashes = medium sensitivity
Three beeps/vibrations/flashes = high sensitivity

When the unit is turned off or the battery is removed, the sensitivity level setting is retained in the memory.

Sensitivity

* To be determined by administration policy and supervisor control.

Testing the Scanner

- Turn on the scanner in the "ON Audio" or "ON Vibrate" mode.
- Pass the scanner over a metal test object to ensure the LED, audio alarm, or the vibrate alarm are functioning properly. If the battery is fresh or recently recharged (more than 7V), the LED next to the ON/OFF button will produce a green light (see Page 8). If the battery is discharged to less than 7V, the LED will produce a yellow light and it is recommended that you replace the battery.

One 9V battery is included with the Matrix 100. Use a 9V-alkaline, 9V-lithium-manganese dioxide, or externally charged 9V-battery. If the battery is fresh or recently recharged (more than 7V), the LED next to the ON/OFF button will produce a green light. If the battery is discharged (less than 7V) the LED will flash a yellow light and it is recommended that you replace the battery.

Battery Life

Based upon measurements, battery life for a 600 mA-hour alkaline battery at room temperature is:

	Hours	Days
ON	216	9
OFF	2880	120

Battery life is doubled with the 1200 mA-hour lithium-manganese dioxide batteries.

Rechargeable 9V batteries can also be used, but battery life per charge is typically much shorter than the life of 9V-alkaline batteries, and depends upon the battery type and the battery recharging system.

WARNING
DO NOT use the earbud jack as a recharging port! Use of the earbud jack as a recharging port may damage the Matrix 100 or the battery charger, and will void the warranty.

Battery Temperature Ratings

Alkaline batteries are rated by the following manufacturer:

Energizer   -18°C to 55°C (0°F to 130°F)
Panasonic   -20°C to 54°C (-4°F to 130°F)

Lithium-manganese dioxide batteries are rated by the following manufacturer:

Duracell   -20°C to 60°C (-4°F to 140°F)
Energizer   -40°C to 60°C (-40°F to 140°F)
Ultralife   -20°C to 60°C (-4°F to 140°F)

Manufacturer's ratings are based upon operating loads quite different from the Matrix 100, so it is possible to have different results.

* For information about special batteries that will operate at temperatures as low as -40°C contact White's Electronics, Inc.

Battery Installation

- Gently slide the battery door open.
- Slide a 9V battery into the battery cavity as shown below.
- Close the battery door.

De-sense Button

On the top edge of the scanner, there is a large rubber "De-sense" button. When depressed, this button will reduce the detectors sensitivity by approximately 50%. This is particularly useful when scanning near rebar reinforced floors. The "De-sense" is only activated as long as the button is depressed. While the "De-sense" button is pressed the ON/OFF LED (see Page 4) will illuminate continuously. If the battery is good, the LED will be green. If the battery is low or defective the LED will be yellow.
Visual indicator LED

De-sense button

The earbud jack accepts a 3mm or 1/8" "Mono" connector.

Earbud jack

Earbud Jack Rubber Plug

The rubber plug helps protect the earbud jack against dirt and moisture.

Earbud jack rubber plug

A lanyard is provided with each Matrix 100. The small nylon loop can be threaded through the lanyard hole and looped back through itself to secure the Matrix 100. The lanyard is tested to withhold approximately 25 pounds of force, before breaking.

Scanning a Person

- **Warning: Follow the approved policy & procedure for scanning a person. This policy & procedure should be approved by the administrator and/or supervisor of the person using the scanner.**

- It is recommended that the operator **"NOT"** touch the individual being scanned with the detector.
- The detector is not a weapon and should not be treated as such and will void the warranty.
- Treat the detector with care. Do not abuse.

National Institute of Justice
Guidelines for use of handheld detectors in schools.

While it is not difficult to learn to use a handheld metal detector correctly, school administrators should not underestimate the value of annual training for their operators, as well as training for staff who may be called upon to serve as backup or supplemental operators. However, on-the-job practice is important in allowing the school to achieve the type of throughput that will be required in order to process students quickly.

Every school will want to tailor its own set of operator procedures to take into consideration its students' and community needs. Some generic procedures:

- The detector should be passed over the scannee's body at a distance of no more than 3 to 4 inches. Avoid touching the body or clothing with the detector. However, for some baggier clothing, such as pants or jackets, it may be necessary to hold the detector against or more into the fabric while scanning in order to stay within 3 to 4 inches of all body surfaces.

• Most handheld metal detectors should be set at their highest sensitivity; an exception to this is if there is significant interference from metal reinforcing in a floor or other nearby material that could cause constant alarms unless the detector's sensitivity is turned down.

• The body scan should be performed each time in the same pattern so that the operator always knows what parts of the body still need scanning. A sample routine is illustrated on Page 18.

1. Ask the scannee to place all carried items, plus any caps or headgear on a table (procedures for manual search of baggage are not covered in this text). The scannee should stand with his or her feet about 18 inches apart, facing away from the table and about 2 feet in front of it. Footprints outlined on the floor or drawn on a mat can greatly help position the scannee properly. Ask the scannee to hold his or her arms out to the sides, parallel to the floor.

2. Quickly run the handheld detector across some piece of conductive material on your own body, such as a belt buckle. The ensuing squeal of the detector will assure you that the scanner is still operating properly.

3. Start at the top of one shoulder of the scannee. With the paddle of the detector held horizontally and parallel to the front of the body, sweep down one side of the front of the torso, down the leg to the ankle, then move to the other ankle and sweep back up the front of this opposite leg and torso, ending with the opposite shoulder. (If a particular detector's detection paddle is less than half the width of the average body, or if a particular body is wider than twice the width of the detection paddle, the pattern will have to be modified to achieve adequate coverage).

4. Sweep the detector paddle over the outside top of the arm from the top of the shoulder to the bottom of the wrist, then up the inside of the arm to the armpit. Sweep down that side of the body to the ankle, then up the inside of that leg and down the inside of the opposite leg, then back up the other leg from the ankle to the underarm. Repeat the sweep of the inside and outside of this arm. Note that it would be particularly important to avoid touching the paddle up against the scannee's body when scanning up and down between the legs.

5. Ask the scannee to turn around. (Arms can be put down now). The pattern used to scan the front of the body should now be repeated over the back of the body.

6. Ask the scannee to grab the edge of the table for support, then to lift one foot up in back of him or herself. Scan across the bottom of the shoe. Repeat for the other foot. The operator should expect to hear a short squeal from the detector when scanning the bottom of shoes or boots with steel shanks or steel toes. Both shoes should cause equivalent squeals.

7. For the head area, start at the top of the forehead and scan around the

top of the head down to the back of the neck.

• When the detector identifies a suspicious item and there is no visible source for the alarm (clothing is shielding the source object), ask the person to show you what they have in that area. For example, for an alarm along the arm or wrist, have the scannee pull up his or her shirt sleeve. Using your detector, duplicate the squeal you heard before, but now over the visible item.

• Do not let the scannee influence you as to what is actually causing an alarm. For instance, if the detector denotes the presence of a suspicious item under a shirt sleeve, do not fail to completely investigate the source of the alarm even though the scannee assures you that it is just his or her watch.

• If the person you are about to scan caused an alarm when walking through a portal metal detector, and your job is to try to locate the source of that alarm on his or her body, do not stop the complete scanning process just because you come across one alarm-causing item. Continue the scan even though you find one or more items in the process.

• The lower abdominal area is particularly difficult to scan because this area is private in nature and because of the metal items usually found in this area: belt buckles, metal buttons or snaps, and metal zippers. When doing the initial front body scan, if an alarm occurs in this area, there are two possible ways to further investigate:

a. Ask the scannee to undo any belt he or she might have on and have him or her pull the belt ends away from the middle of the body. Now scan the zipper area; your handheld metal detector should tell you if it is now only sensing a zipper and/or a metal snap, or if a more suspicious item is present and further investigation is needed.

b. A second approach that some schools use is that, if the lower abdominal area is causing an alarm on the handheld detector, ask the scannee to bend the front of his or her front waistband forward, to ascertain that no weapon is hidden behind it. Facilities need to be available for situations where further investigation can be accomplished privately, but only in the presence of two or more school employees who are the same gender as the scannee.
This is an example of procedures for using a handheld metal detector that has at least a 10-inch zone of direction.

(The preceding guidelines and illustrations were produced by the National Institute of Justice in their report titled The Appropriate and Effective Use of Security Technologies in U.S. Schools. National Institute of Justice, U.S. Department of Justice: Washington, DC (September 1999) Available online at: http://www.ojp.usdoj.gov/nij/pubs-sum/178265.htm)

There have been no conclusive studies showing that the magnetic fields generated by handheld metal detectors will or will not affect personal medical electronic devices (PMEDs), such as pacemakers, cardiac defibrillators, infusion pumps, spinal cord stimulators, etc. Therefore, caution should be used when operating handheld metal detectors near people with the PMEDs.

The Matrix 100 is warranted by White's Electronics, Inc., under normal use, against manufacturing defects for three years from the date of purchase. Equipment returned to an authorized repair center or to the factory during the warranty period will be inspected and evaluated under the performance specifications. White's Electronics will repair or replace, at no charge to the owner, all parts determined to be faulty. Items not covered by this warranty are as follows:

- Batteries
- Failures caused by abuse
- Tampering with the internal electronics
- Battery leakage
- Repairs made by an unauthorized party
- Contaminants
- Use in adverse conditions.

Returns must be prepaid and shipped to:

Maintenance

Perform daily inspection to ensure the Matrix 100 is operating properly. Inspect the battery to ensure it is "fresh" or charged and that the Matrix 100 is clean.

Caution: Any device changes or modifications not expressly approved by White's Electronics, Inc. could void the user's authority to operate this equipment.

NOTE: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:
-- Reorient or relocate the receiving antenna.
-- Increase the separation between the equipment and receiver.
-- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
-- Consult the dealer or an experienced radio/TV technician for help.

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

This "Class B" digital apparatus complies with Canadian ICES-003.

Cet appareil numériqué de la "classe B" est conformé à la norme NMB-003 du Canada.
