4. Conducted emission at mains port test information

4.1 Measurement procedure

Test was applied by following conditions.

Test method:	ANSI C63.4
Frequency range:	0.15MHz to 30MHz
Test place:	Open area test site
EUT was placed on:	Wooden table / 2.3m(W) × 1.0m(D) × 0.8m(H)
Vertical Metal Reference Plane:	2.4m (W) × 2.7m (H) 0.4m away from EUT
Horizontal Metal Reference Plane:	Site 2 - 25.0m x 7.8m
	Site 3 - 40.0m x 7.8m

Test receiver setting	
- Detector:	Quasi-peak, Average
- Bandwidth:	9 kHz

EUT and peripherals are connected to 50Ω/50μH Line Impedance Stabilization Network (LISN) which are connected to reference ground plane, and are placed 80cm away from EUT. Excess of AC power cable is bundled in center. LISN for peripheral is terminated in 50Ω. EUT operating mode is selected to emit the maximum noise. Overall frequency range is investigated with spectrum analyzer using peak detector. Maximum emission configuration is determined by manipulating the EUT, peripherals, interconnecting cables. Then, emission measurements are performed with test receiver in above setting to each current-carrying conductor of the mains port. Sufficient time for EUT, peripherals and test equipment is provided in order for them to warm up to their normal operating condition. If the average limit is met when using a quasi-peak detector receiver, the EUT shall be deemed to meet both limits.

- Test configuration

4.2 Calculation method

Emission level= Reading + (LISN. factor + Cable system loss)
Margin = Limit – Emission level

5. Radiated emission test information

5.1 Measurement procedure

Test was applied by following conditions.

Test method:	ANSI C63.4
Frequency range:	30MHz to 1000MHz
Test place:	Open area test site
EUT was placed on:	Wooden table / 2.3m(W) × 1.0m(D) × 0.8m(H)
Antenna distance:	3m.

Test receiver setting	
- Detector:	Quasi-peak
- Bandwidth:	120kHz

EUT operating mode is selected to emit the maximum noise. Overall frequency range is investigated with spectrum analyzer using peak detector. Then, emission measurements up to 1000MHz were performed with test receiver in above setting. In order to find the maximum emissions, antenna is adjusted between 1m and 4m in height and varied its polarization (horizontal and vertical), and EUT azimuth was also varied by rotating turntable 0 to 360 degrees. Sufficient time for EUT, peripherals and test equipment is provided in order for them to warm up to their normal operating condition. If the average limit is met when using a quasi-peak detector receiver, the EUT shall be deemed to meet both limits.

- Test configuration

5.2 Calculation method

Emission level = Reading + (Ant. factor + Cable system loss – Amp. Gain)
Margin = Limit – Emission level
