Subject: Re: FW: audit

Hello Jon,

In answer to question 3:

The OVPC is equipped with a processor system that controls the RIM radio
modem. This processor extracts data from the Symbol scanner via IrDA and
then processes it. The data can be sent in near real time (i.e. scanner
in holster) or delayed (i.e. scanner not in holster) if the device is
out of radio coverage at the attempted time of transmission.

Please let me know if you require any further information.

Sincerely,
Jerry P. Chilibecki
Engineering Director
