Testing supervised by: Report Approved by:

Valdis V. Liepa Research Scientist

Test report written by: Valdis V. Liepa

#### Summary

Tests for compliance with FCC Regulations, CFR 47, Part 15 and with Industry Canada RSS-210/Gen, were performed on a Lear, FCC ID: KOBHR13A, IC: 3521A-HR13A. This device under test (DUT) is subject to the rules and regulations as a Transceiver.

In testing completed on June 7, 2012, the DUT tested met the allowed specifications for radiated emissions by 1.4 dB. Conducted emissions are not subject to regulation as the DUT is powered by a 12 VDC vehicular power system.

#### 1. Introduction

This Lear Transceiver was tested for compliance with FCC Regulations, Part 15, adopted under Docket 87-389, April 18, 1989 as subsequently amended, and with Industry Canada RSS-210/Gen, Issue 8. Tests were performed at the University of Michigan Radiation Laboratory Willow Run Test Range following the procedures described in ANSI C63.4-2003 "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz". The Site description and attenuation characteristics of the Open Site facility are on file with FCC Laboratory, Columbia, Maryland (FCC Reg. No: 91050) and with Industry Canada, Ottawa, ON (File Ref. No: IC 2057A-1).

#### 2. Equipment Used

The test equipment commonly used in our facility is listed in Table 2.1. Except where indicated as a pretest, monitoring, or support device; all equipment listed below is a part of the University of Michigan Radiation Laboratory (UMRL) quality system. This quality system has been established to ensure all equipment has a clearly identifiable classification, calibration expiry date, and that all calibrations are traceable to national standards.

## 3. Device Under Test

## 3.1 Description & Block Diagram

The DUT is a 433.9 MHz Transceiver designed for automotive/vehicular applications, and as such it is powered by a 12 VDC source. The device is housed in a plastic case approximately 11 x 8 x 2 cm in dimension. For testing, a generic harness was provided by the manufacturer.

Figure 3.1 Block Diagram

Device	[Make], Model	[S/N],P/N	EMC Consideration
DUT	[Lear], RS-13AU	5E1V00	Normal Operating Sample
DUT	[Lear], RS-13AU	5E1V00	CW modified sample
DUT Antenna	[Lear],	5E35E0107	Antenna

## 3.2 Variants and Samples

There is only a single variant of the DUT, as tested. Two samples were provided for testing, one normal operating sample that responded to interrogation from a paired keyfob, and one sample modified for CW transmission with power was supplied.

## 3.3 Modes of Operation

The DUT is capable of operation as a transceiver. In this mode, the DUT receives a manually activated interrogation from a separate paired keyfob transmitting at 433.9 MHz, decodes the interrogation, and responds to this inquiry with a single frame transmission at the same frequency. The DUT antenna and cable are non-removable and are sold with the DUT.

## 3.4 Exemptions

The DUT is permanently installed in a transportation vehicle. As such, digital emissions are exempt (per FCC 15.103(a) and IC correspondence on ICES-003) from regulation.

## 3.5 EMC Relevant Modifications

No EMI Relevant Modifications were performed by this test laboratory. However, during preliminary testing the manufacturer elected to introduce a coil of cable into the antenna feed cable to reduce common mode currents on the antenna feed line. The manufacturer states that the coiled RF feed cable will be implemented as depicted in the documents included in this filing.

#### 4. Emissions Limits

#### 4.1 Radiated Emissions Limits

The DUT tested falls under the category of an Intentional Radiator. The applicable testing frequencies and corresponding emission limits set by both the FCC and IC are given in Tables 4.1 and 4.2 below.

Table 4.1. TX Emission Limits (FCC: 15.231(b), .205(a); IC: RSS-210 2.7 T4).	
--	--

	Fundar		Spurious**			
Frequency	Ave. E <sub>li</sub>	m(3m)	Ave. $E_{\lim}(3m)$			
(MHz)	(µV/m)	$dB (\mu V/m)$	$(\mu V/m)$	$dB (\mu V/m)$		
260.0-470.0	3750-12500*		375-1250			
315	6042	75.6	604.2	55.6

\* Linear interpolation, formula: E = -7083 + 41.67\*f (MHz)

\*\* Measure up to tenth harmonic; 120 kHz BW up to 1 GHz, 1 MHz BW above 1 GHz

Table 4.2. Spurious Emission Limits (FCC: 15.33, .35, .109/209; IC: RSS-210 2.7, T2)

Freq. (MHz)	$E_{lim}$ (3m) $\mu$ V/m	$E_{lim} dB(\mu V/m)$
30-88	100	40.0
88-216	150	43.5
216-960	200	46.0
960-2000	500	54.0

Note: Average readings apply above 1000 MHz (1 MHz BW), Quasi-Peak readings apply to 1000 MHz (120 kHz RBW), PRF of intentional emissions > 20 Hz for QPK to apply.

#### **Power Line Conducted Emissions Limits**

#### Table 4.3 Emission Limits (FCC:15.107 (CISPR); IC: RSS-Gen, 7.2.2 T2).

Frequency	Class A	(dBµV)	Class B (dBµV)		
(MHz)	Quasi-peak	Average	Quasi-peak	Average	
.150 - 0.50	79	66	66 - 56*	56 - 46*	
0.50 - 5	73	60	56	46	
5 - 30	73	60	60	50	

Notes:

1. The lower limit shall apply at the transition frequency

2. The limit decreases linearly with the logarithm of the frequency in the range 0.15-0.50 MHz: \*Class B Quasi-peak:  $dB\mu V = 50.25 - 19.12*\log(f)$ 

\*Class B Average:  $dB\mu V = 40.25 - 19.12*\log(f)$ 

3. 9 kHz RBW

#### 5. Measurement Procedures

#### 5.1 Semi-Anechoic Chamber Radiated Emissions

To become familiar with the radiated emission behavior of the DUT, the device is first studied and measured in our shielded semi-anechoic chamber. In the chamber there is a set-up similar to that of an outdoor 3-meter site, with a turntable, an antenna mast, and a ground plane. Instrumentation includes spectrum analyzers and other equipment as needed.

The DUT is laid on the test table as shown in the included block diagram and/or photographs. A shielded loop antenna is employed when studying emissions from 9 kHz to 30 MHz. Above 30 MHz and below 250 MHz a biconical antenna is employed. Above 250 MHz a ridge or and standard gain horn antennas are used. The spectrum analyzer resolution and video bandwidths are set so as to measure the DUT emission without decreasing the emission bandwidth (EBW) of the device. Emissions are studied for all orientations (3-axes) of the DUT and all test antenna polarizations. In the chamber, spectrum and modulation characteristics of intentional carriers are recorded. Receiver spurious emissions are measured with an appropriate carrier signal applied. Associated test data is presented in subsequent sections.

#### 5.2 Outdoor Radiated Emissions

After measurements are performed indoors, emissions on our outdoor 3-meter Open Area Test Site (OATS) are made, when applicable. If the DUT connects to auxiliary equipment and is table or floor standing, the configurations prescribed in ANSI C63.4 are employed. Alternatively, an on-table layout more representative of actual use may be employed if the resulting emissions appear to be worst-case in such a configuration. Any intentionally radiating elements are placed on the test table flat, on their side, and on their end (3-axes) and worst case emissions are recorded. For each configuration the DUT is rotated 360 degrees about its azimuth and the receive antenna is raised and lowered between 1 and 4 meters to maximize radiated emissions from the device. Receiver spurious emissions are measured with an appropriate carrier signal applied. For devices with intentional emissions below 30 MHz, our shielded loop antenna at a 1 meter receive height is used. Low frequency field extrapolation to the regulatory limit distance is employed as needed. Emissions between 30 MHz and 1 GHz are measured using tuned dipoles and/or biconical antennas. Care is taken to ensure that the RBW and VBW used meet the regulatory requirements, and that the EBW of the DUT is not reduced. The Photographs included in this report show the Test Setup.

#### 5.3 Radiated Field Computations

To convert the dBm values measured on the spectrum analyzer to  $dB(\mu V/m)$ , we use expression

$$E3(dB\mu V/m) = 107 + PR + KA - KG + KE - CF$$

where

- PR = power recorded on spectrum analyzer, dBm, measured at 3 m
  - KA = antenna factor, dB/m

KG = pre-amplifier gain, including cable loss, dB

- KE = duty correction factor, dB
- CF = distance conversion (employed only if limits are specified at alternate distance), dB

When presenting the data at each frequency, the highest measured emission under all of the possible DUT orientations (3-axes) is given.

#### 5.4 Indoor Power Line Conducted Emissions

When applicable, power line conducted emissions are measured in our semi-anechoic chamber. If the DUT connects to auxiliary equipment and is table or floor standing, the configurations prescribed in ANSI C63.4 are employed. Alternatively, an on-table layout more representative of actual use may be employed if the resulting emissions appear to be worst-case in such a configuration.

The conducted emissions measured with the spectrum analyzer and recorded (in  $dB\mu V$ ) from 0-2 MHz and 2-30 MHz for both the ungrounded (Hi) and grounded (Lo) conductors. The spectrum analyzer is set to peak-hold mode in order to record the highest peak throughout the course of functional operation. Only when the emission exceeds or is near the limit are quasi-peak and average detection used.

#### 5.5 Supply Voltage Variation

Measurements of the variation in the fundamental radiated emission were performed with the supply voltage varied by no less than 85% and 115% of the nominal rated value. For battery operated equipment, tests were performed using a new battery, and worst case emissions are re-checked employing a new battery.

#### 6. Test Results

#### 6.1 Radiated Emissions

### 6.1.1 Correction for Pulse Operation

When the transmitter is automatically activated (i.e. when it receives a manually activated interrogating transmission from a paired two-way keyfob held by the user), it can, in the worst case, transmit a single frame in response. This frame consists of four (4) 0.275 ms wake pulses followed by thirty-one (31) Manchester encoded data pulses. Only a single frame may occur within any given 100 ms window. See Figure 6.1. Computing the duty factor results in:

 $K_E = (4 \text{ x } 0.275 \text{ ms} + 31 \text{ x } 0.275 \text{ ms}) / 100 \text{ ms} = 0.096 < -20.0 \text{ dB}.$ 

#### 6.1.2 Emission Spectrum

The relative DUT emission spectrum is recorded and is shown in Figure 6.2.

#### 6.1.3 Emission Bandwidth

The emission bandwidth of the signal is shown in Figure 6.3. The allowed 99% bandwidth is 0.25% of 433.9 MHz, or 1.085 MHz. From the plot we see that the EBW is 68.0 kHz.

### 6.1.4 Supply Voltage and Supply Voltage Variation

The DUT has been designed to be powered by a 12 VDC vehicular power system. For this test, relative radiated power was measured at the fundamental as the voltage was varied from 6.0 to 18.0 volts. The emission variation is shown in Figure 6.4.

Nominal Supply Voltage	$V_{oc} =$	12.3 V
Ave. current draw	I =	58 mA (cw)

### 6.2 Conducted Emissions

These tests do not apply, since the DUT is powered from a 12 VDC battery.

## Table 6.1 Highest Emissions Measured

Meas. 05/31/2012; U of Mich.

Figure 6.1. Transmission modulation characteristics. (top) complete transmission, (center) expanded transmission, (bottom) expanded word.

Figure 6.2. Emission spectrum of the DUT (pulsed emission). Amplitudes are only indicative (not calibrated).

Figure 6.3. Measured emission bandwidth of the DUT (pulsed).

Figure 6.4. Relative emission at fundamental vs. supply voltage (pulsed).
