0 Summary

0.1 Technical Report Summary

Type of Authorization:

Certification for an Unintentional Radiator (Class B digital device)

Applicable FCC Rules:

Prepared in accordance with the requirements of FCC Rules and Regulations as listed in 47 CFR Ch.1 Parts 0 to 19 (10-1-98 Edition). The following subparts are applicable to the results in this test report.

Part 2, Subpart J - Equipment Authorization Procedures, Certification Sections

Part 15, Subpart B - Unintentional Radiators

§ 15.101 Equipment authorization requirement

§ 15.107 Conducted limits

§ 15.109 Radiated emission limits

Summary Test Results:

The EUT complied with all performed tests as listed in chapter 0.2 Measurement Summary

0.2 Measurement Summary

FCC Part 15, Subpart B §15.107

Conducted Emissions (AC Power Line)

The measurement was performed according to ANSI C63.4 1992

OP-Mode	Setup	Port	Final Result
op-mode 2	4Ts01d01	AC port of charger	passed
op-mode 2	4Ts01b01	AC port of charger	passed

FCC Part 15, Subpart B §15.31, §15.109

Spurious Radiated Emissions

The measurement was performed according to ANSI C63.4 1992

OP-Mode	Setup	Port	Final Result
op-mode 2	4Ts01d01	Enclosure	passed
op-mode 2	4Ts01b01	Enclosure	passed

1. Administrative Data

1.1 Testing Laboratory

Company Name: 7 Layers AG
Address: Borsigstr. 11
40880 Ratingen
Germany

This facility has been fully described in a report submitted to the FCC and accepted under the registration number 96716.

The test facility is also accredited by the following accreditation organisation:

- Deutscher Akkreditierungs Rat DAR-Registration no. TTI-P-G 178/99

Responsible for Accreditation Scope: Dipl.-Ing Bernhard Retka
Dipl.-Ing Arndt Stöcker
Dipl.-Ing Thomas Hoell

1.2 Project Data

Responsible for testing and report: Robert Machulec
Receipt of EUT: 13.02.2004
Date of Test(s): 13.02.2004 - 25.03.2004
Date of Report: 01.04.2004

1.3 Applicant Data

Company Name: SMART Modular Technologies, Inc.
Address: 4211 Starboard Drive

Fremont, CA 94538
USA
Contact Person: Lubos Honzik

1.4 Manufacturer Data

Company Name: PT Selectron Technology
Address: Jalan Rambutan, Lot 515

Muka Kuning, Batam 29433
Indonesia
Contact Person: -

2.0 Product Labeling

2.1 FCC ID Label:

At the time of the report there was no FCC label available.

2.2 Location of Label on the EUT:

see above

3. Testobject Data

3.1 General EUT Description

Equipment under Test:	Bluetooth (R) Transceiver
Type Designation:	NeoChat NC-10
Kind of Device: (optional)	Mobile Messaging Terminal
Voltage Type:	AC
Voltage level:	115 V

General product description:

Bluetooth is a short-range radio link intended to be a cable replacement between portable and/or fixed electronic devices.

Bluetooth operates in the unlicensed ISM Band at 2.4 GHz. In the US a band of 83.5 MHz width is available. In this band, 79 RF channels spaced 1MHz apart are defined. The channel is represented by a pseudo-random hopping sequence through the 79 channels. The channel is divided into time slots, with a nominal slot length of 625µs, where each slot corresponds to different RF hop frequencies. The nominal hop rate is 1600 hops/s. All frequencies are equally used. The average time of occupancy is 0.3797 s within a 30 second period. The symbol rate on the channel is 1 Ms/s.

The EUT provides the following ports:

Ports

AC port of charger
Enclosure

The main components of EUT are listed and described in Chapter 3.2

3.2 EUT Main components:

Type, S/N, Short Descriptions etc. used in this Test Report

Short Description	Equipment under Test	Type Designation	Serial No.	HW Status	SW Status	Date of Receipt
EUT A	NeoChat NC-10	-	sample 1	1.3	IXI Sleek rev. 1.0	13.02.2004
EUT is equipped with integral antenna (gain=2dBi)						
EUT B	AC charger	Cincon T3E-05V055-134A03	sample 1	-	-	09.03.2004
charger with ferrite						
EUT C	AC charger	PIE	sample 1	-	-	13.02.2004

NOTE: The short description is used to simplify the identification of the EUT in this test report

3.3 Ancillary Equipment

For the purposes of this test report, ancillary equipment is defined as equipment which is used in conjunction with the EUT to provide operational and control features to the EUT. It is necessary to configure the system in a typical fashion, as a customer would normally use it. But nevertheless Ancillary Equipment can influence the test results.

Short Description	Equipment under Test	Type Designation	HW Status	SW Status	Serial No.	FCC Id
-------------------	----------------------	------------------	-----------	-----------	------------	--------

3.4 EUT Setups

This chapter describes the combination of EUT's and ancillary equipment used for testing.

Setup No.	Combination of EUTs	Description
4Ts01b01	EUT A + EUT C	NeoChat NC-10 + Charger PIE
4Ts01d01	EUT A + EUT B	NeoChat NC-10 + Charger Cincon with ferrite

3.5 Operating Modes

This chapter describes the operating modes of the EUT's used for testing.

Op. Mode	Description of Operating Modes	Remarks
op-mode 2	TX mode, the EUT A transmits continuously on 2441 MHz	

4. Test Results

4.1 Conducted Emissions (AC Power Line)

Standard FCC Part 15, 10-1-98
Subpart B

The test was performed according to: ANSI C63.4 1992

4.1.1 Test Description

The test set-up was made in accordance to the general provisions of ANSI C63.4-1992.

The Equipment Under Test (EUT) was setup in a shielded room to perform the conducted emissions measurements in a typical installation configuration. The EUT was powered from 50 μ H || 50 Ohm Line Impedance Stabilization Network (LISN). The LISN's unused connections were terminated with 50 Ohm loads.

The measurement procedure consists of two steps. It is implemented into EMI test software ES-K1 from R&S.

Step 1: Preliminary scan

Preliminary test to identify the highest amplitudes relative to the limit.

EMI receiver settings:

- Detector: Peak - Maxhold
- Frequency range: 150 kHz – 30 MHz
- Frequency steps: 5 kHz
- IF-Bandwidth: 10 kHz
- Measuring time / Frequency step: 1 ms
- Measurement on phase + neutral lines of the power cords

Intention of this step is, to determine the conducted EMI-profile of the EUT. With this data, the test system performs (to reduce the number of final measurements) a data reduction with the following parameters:

- Offset for acceptance analysis: Limit line – 6 dB
- Maximum number of final measurements: 6

Step 2: Final measurement

With the frequencies determined in step 1, the final measurement will be performed.

EMI receiver settings:

- Detector: Quasi-Peak
- IF - Bandwidth: 9 kHz
- Measuring time: 1s / frequency

At the final test the cable were and moved within the range of positions likely to find their maximum emission.

After the measurement a plot will be generated which contains a diagram with the results of the preliminary scan and a chart with the frequencies and values of the results of the final measurement.

.

4.1.2 Test Limits

FCC Part 15, Subpart B, §15.107

Frequency Range (MHz):	QP Limit (dBμV)
0.15 – 0.5	66 to 56
0.5 – 5	56
5 – 30	60

Frequency Range (MHz):	AV Limit (dBμV)
0.15 – 0.5	56 to 46
0.5 – 5	46
5 – 30	50

Used conversion factor: Limit (dBμV) = 20 log (Limit (μV)/1μV)

4.1.3 Test Protocol

Temperature: 25 °C
Air Pressure: 1010 hPa
Humidity: 30 %

Op. Mode	Setup	Port	Test Parameter
op-mode 2	4Ts01b01	AC port of charger	

Powerline	Frequency MHz	Measured Value dBμV	Delta to Limit dBμV	Remarks
N	0,17	45,90	9,10	value measured with AV detector

4.1.3 Test result: Conducted Emissions (AC Power Line)

FCC Part 15, Subpart B		Op. Mode	Setup	Port	Result
	op-mode 2	4Ts01	b01	AC port of charger	passed
	op-mode 2	4Ts01	d01	AC port of charger	passed

4.2 Spurious Radiated Emissions

Standard FCC Part 15, 10-1-98
Subpart B

The test was performed according to: ANSI C63.4 1992

4.2.1 Test Description

The test set-up was made in accordance to the general provisions of ANSI C63.4-1992.

The Equipment Under Test (EUT) was set up on a non-conductive table 1.0 x 2.0 m in the semi-anechoic chamber. The test was performed at an EUT to receiving antenna distance of 3m.

The radiated emissions measurements were made in a typical installation configuration.

The measurement procedure consists of four steps. It is implemented into EMI test software ES-K1 from R&S.

Step 1: Preliminary scan

Preliminary test to identify the highest amplitudes relative to the limit.

Settings for step 1:

- Detector: Peak-Maxhold
- Frequency range: 30 – 1000 MHz
- Frequency steps: 60 kHz
- IF-Bandwidth: 120 kHz
- Measuring time / Frequency step: 100 μ s
- Turntable angle range: -180 to 180 °
- Turntable stepsize: 90°
- Height variation range: 1 – 3m
- Height variation stepsize: 2m
- Polarisation: Horizontal + Vertical

Intention of this step is, to determine the radiated EMI-profile of the EUT. With this data, the test system performs (to reduce the number of final measurements) a data reduction with the following parameters:

- Offset for acceptance analysis: Limit line – 6 dB
- Maximum number of final measurements: 12

Step 2:

With the frequencies determined in step 1, an additional measurement with the following settings will be performed. Intention of this step is, to find out the approximate turntable angle and antenna height for each frequency.

Settings for step 2:

- Detector: Peak – Maxhold
- Measured frequencies: in step 1 determined frequencies
- IF – Bandwidth: 120 kHz
- Measuring time: 100ms
- Turntable angle range: -180 to 180 °
- Turntable stepsize: 45°
- Height variation range: 1 – 4m
- Height variation stepsize: 0,5m

- Polarisation: horizontal + vertical

After this step the EMI test system has determined the following values for each frequency (of step 1):

- Frequency
- Azimuth value (of turntable)
- Antenna height

The last two values have now the following accuracy:

- Azimuth value (of turntable): 45°
- Antenna height: 0,5m

Step 3:

In this step the accuracy of the turntable azimuth and antenna height will be improved. This is necessary to find out the maximum value of every frequency.

For each frequency the turntable azimuth and antenna height, which was determined in step 3, will be adjusted.

The turntable azimuth will be slowly varied by $\pm 22,5^\circ$ around this value. During this action the value of emission is continuously measured. The turntable azimuth at the highest emission will be recorded and adjusted. In this position the antenna height is also slowly varied by ± 25 cm around the antenna height determined in step 3. During this action the value of emission is also continuously measured. The antenna height of the highest emission will also be recorded and adjusted.

Settings for step 3:

- Detector: Peak – Maxhold
- Measured frequencies: in step 1 determined frequencies
- IF – Bandwidth: 120 kHz
- Measuring time: 100ms
- Turntable angle range: $-22,5^\circ$ to $+ 22,5^\circ$ around the value determined in step 2
- Height variation range: -0,25m to $+ 0,25$ m around the value determined in step 2

Step 4:

With the settings determined in step 3, the final measurement will be performed:

EMI receiver settings for step 4:

- Detector: Quasi-Peak(< 1GHz)
- Measured frequencies: in step 1 determined frequencies
- IF – Bandwidth: 120 kHz
- Measuring time: 1s

The following modifications apply to the measurement procedure for the frequency range

above 1 GHz:

The measurement distance was reduced to 1m. The results were extrapolated by the extrapolation factor of 20 dB/decade (invers linear-distance for field strength measurements, invers linear-distance squared for the power reference level measurements). Due to the fact that in this frequency range a double ridged wave guided horn antenna (up to 18 GHz) and a horn antenna (18-25 GHz) are used, the steps 2-4 are omitted. Step 1 was performed with one height of the receiving antenna only.

Detector: Peak, Average

RBW = VBW = 1 MHz, above 7 GHz 100 kHz

After the measurement a plot will be generated which contains a diagram with the results of the preliminary scan and a chart with the frequencies and values of the results of the final measurement.

4.2.2 Test Limits

FCC Part 15, Subpart B, §15.109, Radiated Emission Limits

Frequency Range (MHz):	Class B Limit (dBµV/m)
30 – 88	40,0
88 – 216	43,5
216 – 960	46,0
above 960	54,0

§15.35(b)

..., there is also a limit on the radio frequency emissions, as measured using instrumentation with a peak detector function, corresponding to 20 dB above the maximum permitted average limit....

Used conversion factor: Limit (dBµV/m) = 20 log (Limit (µV/m)/1µV/m)

4.2.3 Test Protocol

Temperature: 23°C

Air Pressure: 1009hPa

Humidity: 30%

Op. Mode Setup Port Test Parameter

op-mode 2 4Ts01b01 Enclosure

Polarisation	Frequency MHz	Corrected Value dBµV/m			Limit QP/AV dBµV/m	Limit Peak dBµV/m	Delta to AV/QP Limit/dB	Delta to QP Limit dB
		QP	Peak	AV				
Vertical	96,00		30,44		43,50			13,06
Vertical	112,02		33,58		43,50			9,92
Vertical	144,00		33,91		43,50			9,59
Vertical	160,02		30,73		43,50			12,77
Vertical	175,98		34,67		43,50			8,83
Vertical	192,00		33,63		43,50			9,87
Vertical	240,00		32,17		46,00			13,83
Vertical	256,02		31,14		46,00			14,86
Vertical	271,98		32,04		46,00			13,96

Remark: Tested up to 1 GHz.

No spurious emission (peak value) in the range 6 dB below the limit found.

Therefore no measurements with QP detector were performed acc. to steep 1 of the above describe measurement procedure.

Temperature: 23°C
Air Pressure: 1009hPa
Humidity: 30%

Op. Mode	Setup	Port	Test Parameter
op-mode 2	4Ts01d01	Enclosure
