

FCC ID: KR5180528

According to KDB 447498 section 4.3.1, the 1-g SAR test exclusion thresholds at test separation distance  $\leq 50$  mm are determined by:

$[(\text{max. power of channel, including tune-up tolerance, mW}) / (\text{min. test separation distance, mm})] \cdot [\sqrt{f(\text{GHz})}] \leq 3.0$

The tune-up power is 5dBm +/- 1dB, therefore the highest tune-up power is  
6.0 dBm (3.98107 mW) @ 433.92 MHz

When the minimum *test separation distance* is  $< 5$  mm, a distance of 5 mm according to 5) in section 4.1 is applied to determine SAR test exclusion.

So,

$( 3.9810\text{mW} / 5\text{mm} ) * ( 0.43392\text{GHz} ^{0.5} ) = 0.52448$

$[(\text{max. power of channel, including tune-up tolerance, mW}) / (\text{min. test separation distance, mm})] * [\sqrt{f(\text{GHz})}] = 0.52448 < 3.0$

Therefore, standalone SAR measurements are not required for both head and body.
