Abstract

This report has been prepared on behalf of Broadcast Sports, Inc. to support the attached Application for Equipment Authorization. The test report and application are submitted for a Licensed Non-Broadcast Station Transmitter under Part 74 F of the FCC Rules and Regulations. This Federal Communication Commission (FCC) Certification Test Report documents the test configuration and test results for a Broadcast Sports, Inc. Smurf Video Transmitter.

Testing was performed on an Open Area Test Site (OATS) of Washington Laboratories, Ltd, 7560 Lindbergh Drive, Gaithersburg, MD 20879. Site description and site attenuation data have been placed on file with the FCC's Sampling and Measurements Branch at the FCC laboratory in Columbia, MD. Washington Laboratories, Ltd. has been accepted by the FCC and approved by NIST NVLAP (NVLAP Lab Code: 200066-0) as an independent FCC test laboratory.

The Broadcast Sports, Inc. Smurf Video Transmitter complies with the limits for a Licensed Non-Broadcast Station Transmitter device under Part 74 F of the FCC Rules and Regulations.

Table of Contents

List of Figures

1 Introduction

1.1 Compliance Statement

The Broadcast Sports, Inc. Smurf Video Transmitter complies with the limits for a Licensed Non-Broadcast Station Transmitter device under Part 74F of the FCC Rules and Regulations.

1.2 Test Scope

Tests for radiated and conducted emissions were performed. All measurements were performed according to the 2001 version of ANSI C63.4. The measurement equipment conforms to ANSI C63.2 Specifications for Electromagnetic Noise and Field Strength Instrumentation.

1.3 Contract Information

Customer:	Broadcast Sports, Inc. 1360 Blair Drive Odenton, MD 21113
Purchase Order Number:	4472DW
Quotation Number:	60412-A

1.4 Test Dates

Testing was performed from February 23, 2004 to March 11, 2004.

1.5 Test and Support Personnel

Washington Laboratories, LTD	James Ritter

2 Equipment Under Test

2.1 EUT Identification & Description

The SMF-Xmtr is a portable video transmitter specifically designed to meet the growing needs of the mobile television broadcast industry. The unit is designed to be Certificated per CFR 47, Part 74, Subpart F and functions as a stand-alone transmitter for a TV ENG station. The transmitter has 16 preset channels that are factory tuned to any frequency between 1999 to 2496 MHz in 250 kHz steps in accordance with FCC specifications.

The SMF-Xmtr has one video and one audio input. The programmable audio sub-carrier provides for the transmission of voice or telemetry. A TTL level interface enables the unit to be remotely operated and provides control of all internal functions and status monitoring.

SMF-XMTR RF FRONT VIEW

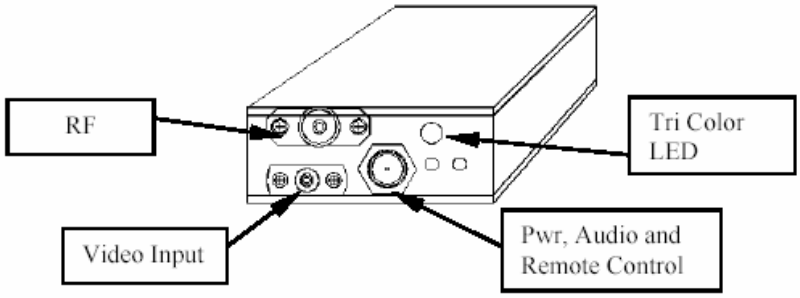

Table 1. Device Summary

ITEM	DESCRIPTION
Manufacturer:	Broadcast Sports, Inc.
FCC ID Number	KTB-SMF-XMTR
EUT Name:	Video Transmitter
Model:	Smurf
FCC Rule Parts:	§74 F
Frequency Range:	1999M – 2492MHz
Maximum Output Power:	250mW
Modulation:	FM
Necessary Bandwidth:	8.84 MHz
Keying:	Continuous
Type of Information:	Video and Audio
Number of Channels:	16 (0-15)
Power Output Level	Fixed
Antenna Type	Connector
Frequency Tolerance:	>0.005%
Emission Type(s):	FM
Interface Cables:	1 Power/Audio/Remote 1 Video in 1 RF out
Power Source & Voltage:	12Vdc from vehicle
Emissions Designator	8M84F3W

2.2 Test Configuration

The EUT was configured with the required cables, power supply, and a Tektronix NTSC Signal Generator.

2.3 Testing Algorithm

The Smurf was operated continuously by supplying an NTSC signal to the input, adjusted for peak signal, which modulated the carrier.

Worst-case emission levels are provided in the test results data.

2.4 Test Location

All measurements herein were performed at Washington Laboratories, Ltd. test center in Gaithersburg, MD. Site description and site attenuation data have been placed on file with the FCC's Sampling and Measurements Branch at the FCC laboratory in Columbia, MD. Washington Laboratories, Ltd. has been accepted by the FCC and approved by NIST NVLAP (NVLAP Lab Code: 200066-0) as an independent FCC test laboratory.

2.5 Measurements

2.5.1 References

ANSI C63.2 Specifications for Electromagnetic Noise and Field Strength Instrumentation

ANSI C63.4 American National Standard for Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz

Land Mobile FM or PM Communications Equipment Measurement and Performance Standards (ANSI/TIA/EIA-603-93)

2.6 Measurement Uncertainty

All results reported herein relate only to the equipment tested. For the purposes of the measurements performed by Washington Laboratories, the measurement uncertainty is ±2.3 dB. This has been calculated for a *worst-case situation* (radiated emissions measurements performed on an open area test site).

The following measurement uncertainty calculation is provided:

$$\text{Total Uncertainty} = (A^2 + B^2 + C^2)^{1/2}/(n-1)$$

where:

A = Antenna calibration uncertainty, in dB = 2 dB

B = Spectrum Analyzer uncertainty, in dB = 1 dB

C = Site uncertainty, in dB = 4 dB

n = number of factors in uncertainty calculation = 3

Thus, Total Uncertainty = $0.5\ (2^2 + 1^2 + 4^2)^{1/2} = \pm 2.3$ dB.

3 Test Equipment

Table 2 shows a list of the test equipment used for measurements along with the calibration information.

4 Test Results

4.1 RF Power Output: (FCC Part §2.1046)

The output from the transmitter was connected to a power meter and the output power measured.

Table 3. RF Power Output

Channel and/or Frequency	Measured Level (dBm)	Measured Level (Watts)	Rated (Watts)	Limit (Watts)
Channel 1- 1999 MHz	19.80	0.095	0.250	12
Channel 8- 2458 MHz	22.05	0.160	0.250	12
Channel C – 2316 MHz	23.8	0.240	0.250	12

4.2 Modulation Characteristics (FCC Part §2.201)

To determine the deviation frequency, an RF signal generator was input to the modulation input of the transmitter. The transmitter output was connected to a spectrum analyzer. The 1Vp-p sinewave modulating frequency was increased and the carrier observed on the spectrum analyzer.

As the modulation frequency is increased, the fundamental signal was observed for nulls. At the null the side lobes were measured and compared to the Bessel Function chart for a modulation index of 2.4. Only one null was located as the modulation frequency was scanned up through 15MHz.

The spectrum was plotted at each of the three carrier frequencies measured and the first four Bessel terms measured. Adjusting the modulation frequency for a null in carrier and where the Bessel functions yield:

Jc1 = -5.8 dB

Jc2 = -7.3 dB

Jc3 = -14.1 dB

Jc4 = -23.9 dB

Deviations for each channel are recorded in

Table 4.

Table 4. Deviation Measurements

Frequency	Deviation Frequency (MHz)
Channel 1: 1999 MHz	1.297
Channel 8: 2454 MHz	1.288
Channel 11: 2316 MHz	1.304

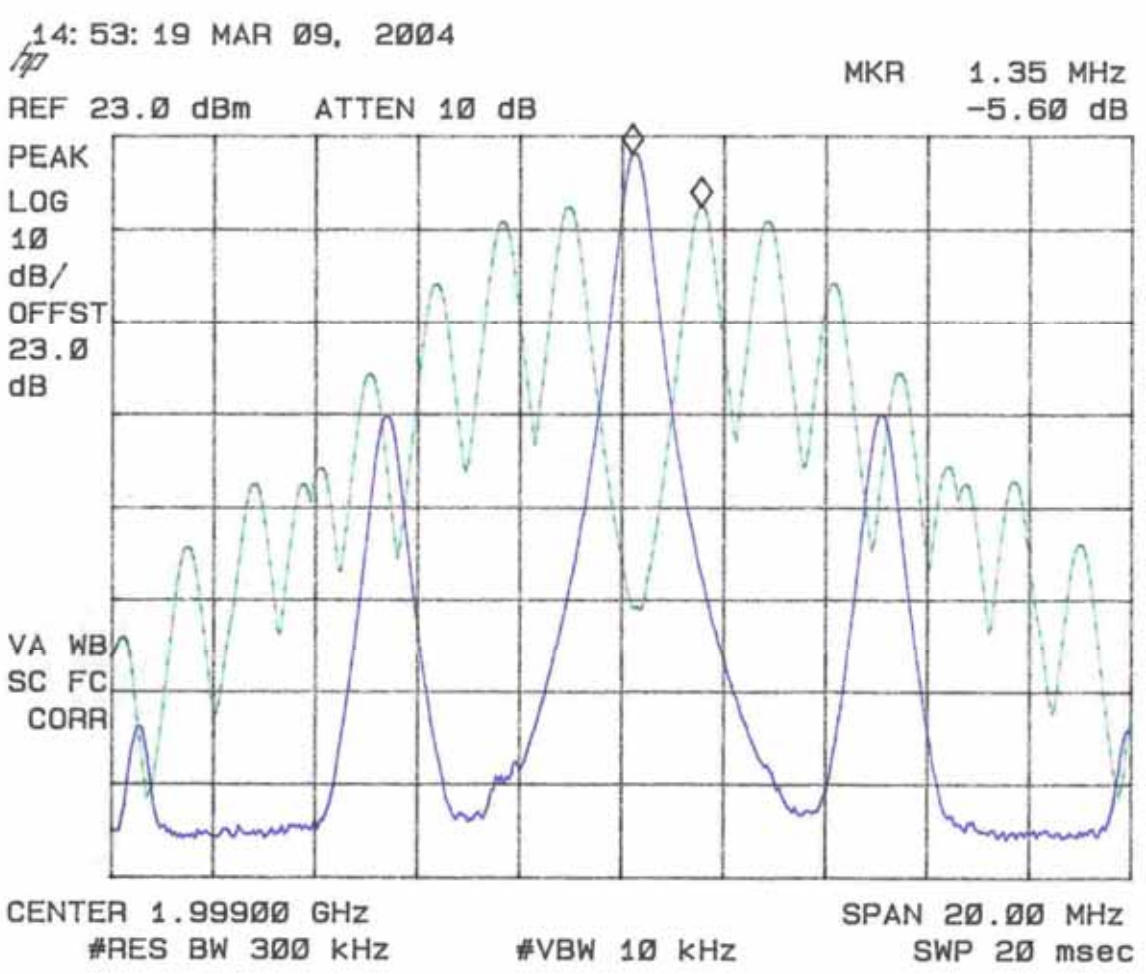

Figure 1. Modulated Carrier, Channel 1

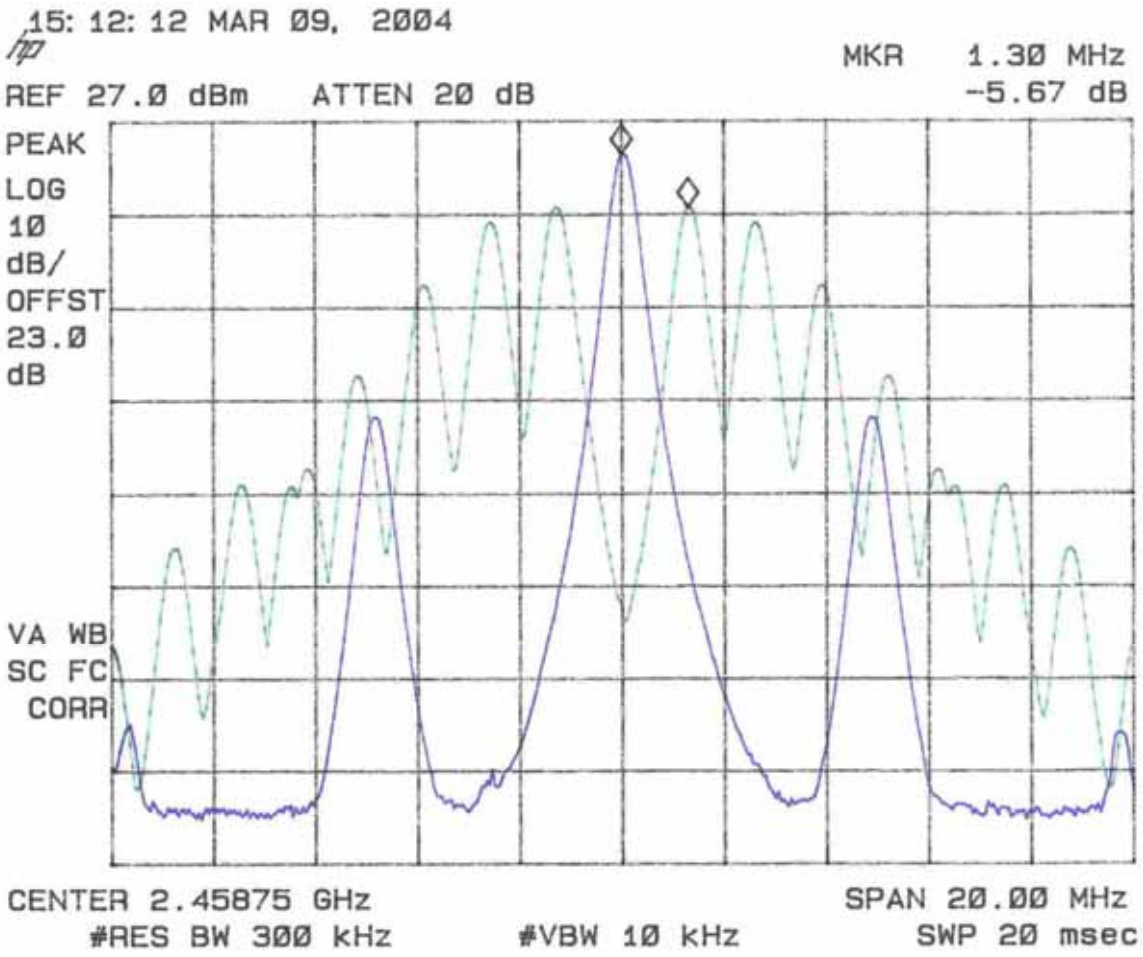

Figure 2. Modulated Carrier, Channel 8

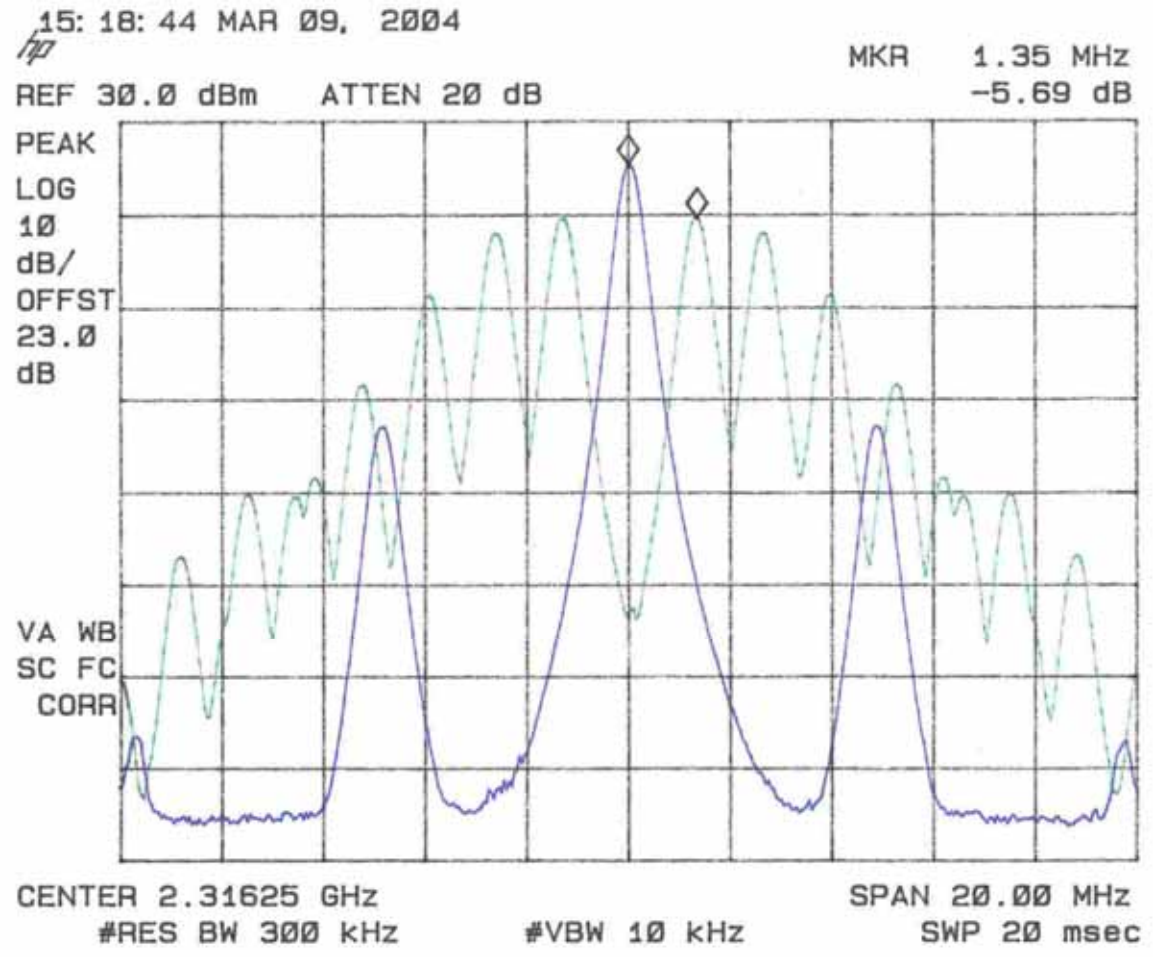

Figure 3. Modulated Carrier, Channel 11

4.3 Emission Designator

The emission designator is determined from the necessary bandwidth, the type of modulation and the information conveyed in the signal.

Necessary bandwidth is determined from:

Bn = 2M + 2 DK

Where,

M = Deviation = 1.304 MHz

D = Deviation X Modulation Index = 1.304 MHz X 2.4 = 3.13MHz

And K=1

Table 5. Modulation Parameters

Parameter	Result
Modulation Index (from Bessel function plot)	2.4%
M Deviation	1.304MHz
D = 2.4M	3.13MHz

Thus,

Bn = 2M + 2DK = (2 X 1.304) + (2 X3.13) = 8.84MHz

First Symbol: F (Frequency Modulation)

Second Symbol: 3 (Single channel carrying analogue information)

Third Symbol: W (video and audio)

Emission Designator: 8M84F3W

4.4 Occupied Bandwidth: (FCC Part §2.1049)

Occupied bandwidth was performed by coupling the output of the EUT to the input of a spectrum analyzer.

At full modulation, the occupied bandwidth was measured with the following results:

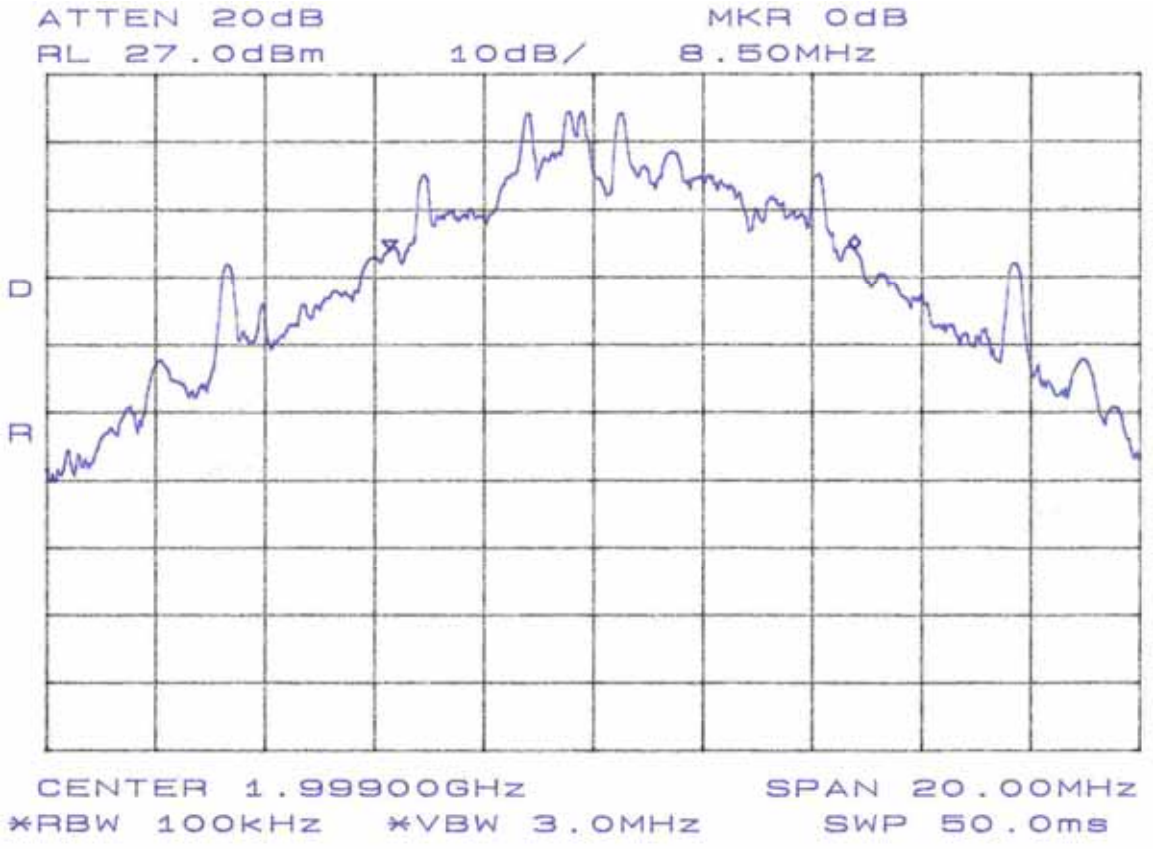

Figure 4. Occupied Bandwidth, Channel 1

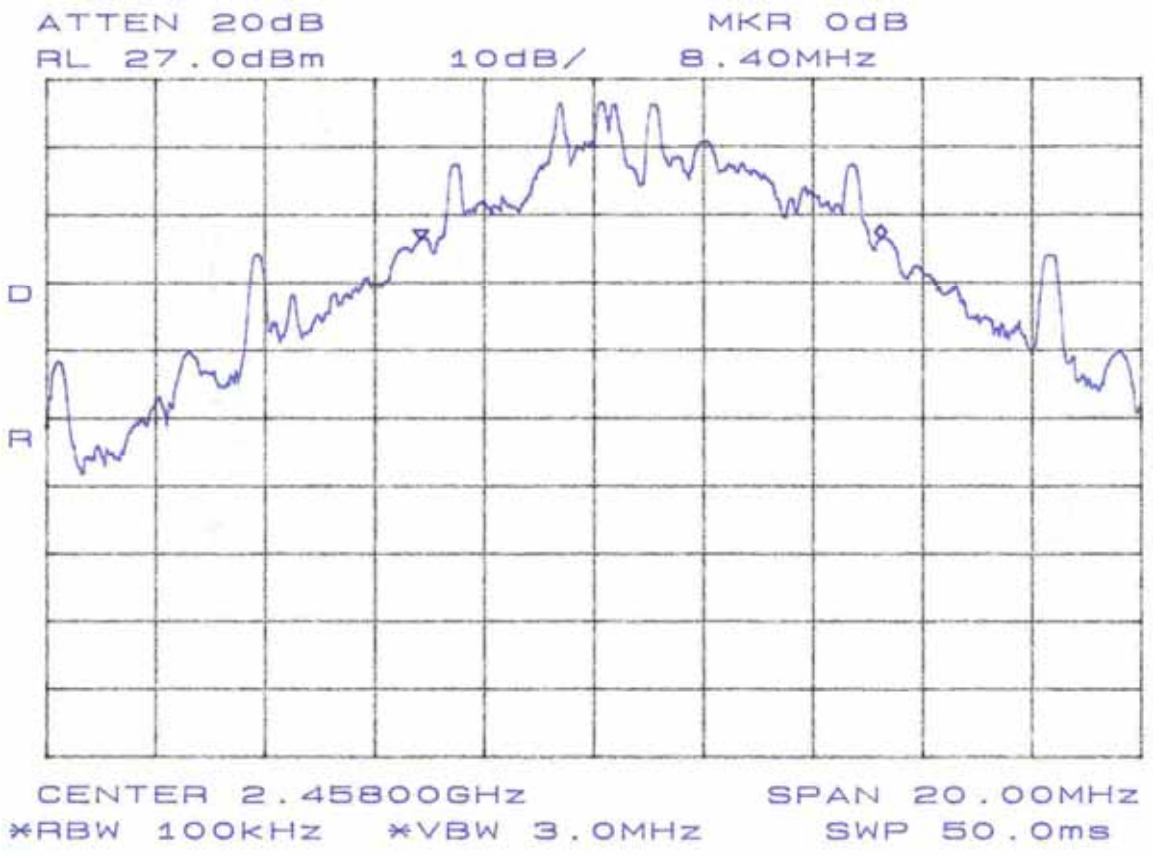

Figure 5. Occupied Bandwidth, Channel 8

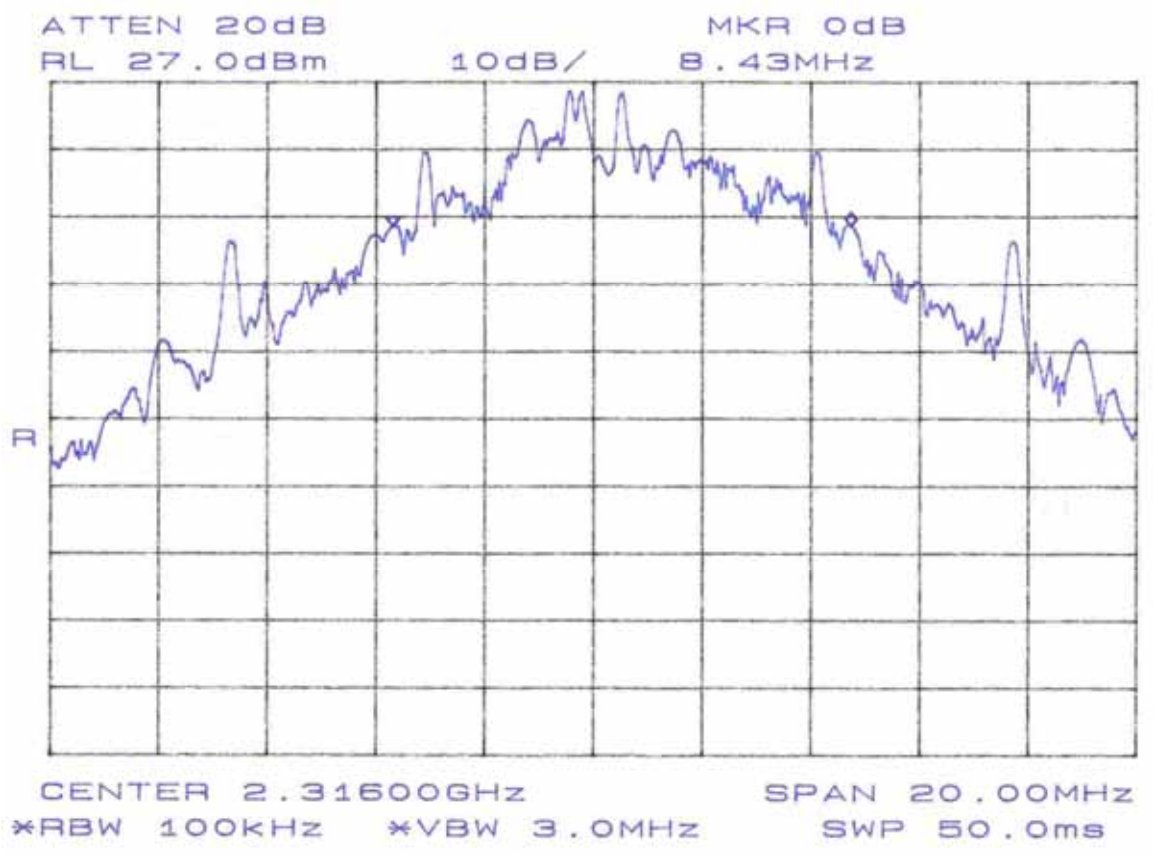

Figure 6. Occupied Bandwidth, Channel 11

Table 6 provides a summary of the Occupied Bandwidth Results.

Table 6. Occupied Bandwidth Results

Frequency	**Occupied Bandwidth (20dB)**
Low Channel: 1999MHz	8.5 MHz
Mid Channel: 2315.3MHz	8.4 MHz
High Channel: 2454MHz	8.43 MHz

4.5 Emissions and emission limitations to § 74.637

Emissions limitations are specified in § 74.637. The output of the transmitter was connected to the input of the spectrum analyzer and the transmitter modulated. The emissions from 30 MHz to the tenth harmonic of the operating frequency were measured and provided in the following figures.

For the emission mask measurements the resolution bandwidth was set to 100kHz and the video bandwidth was set to 3MHz.

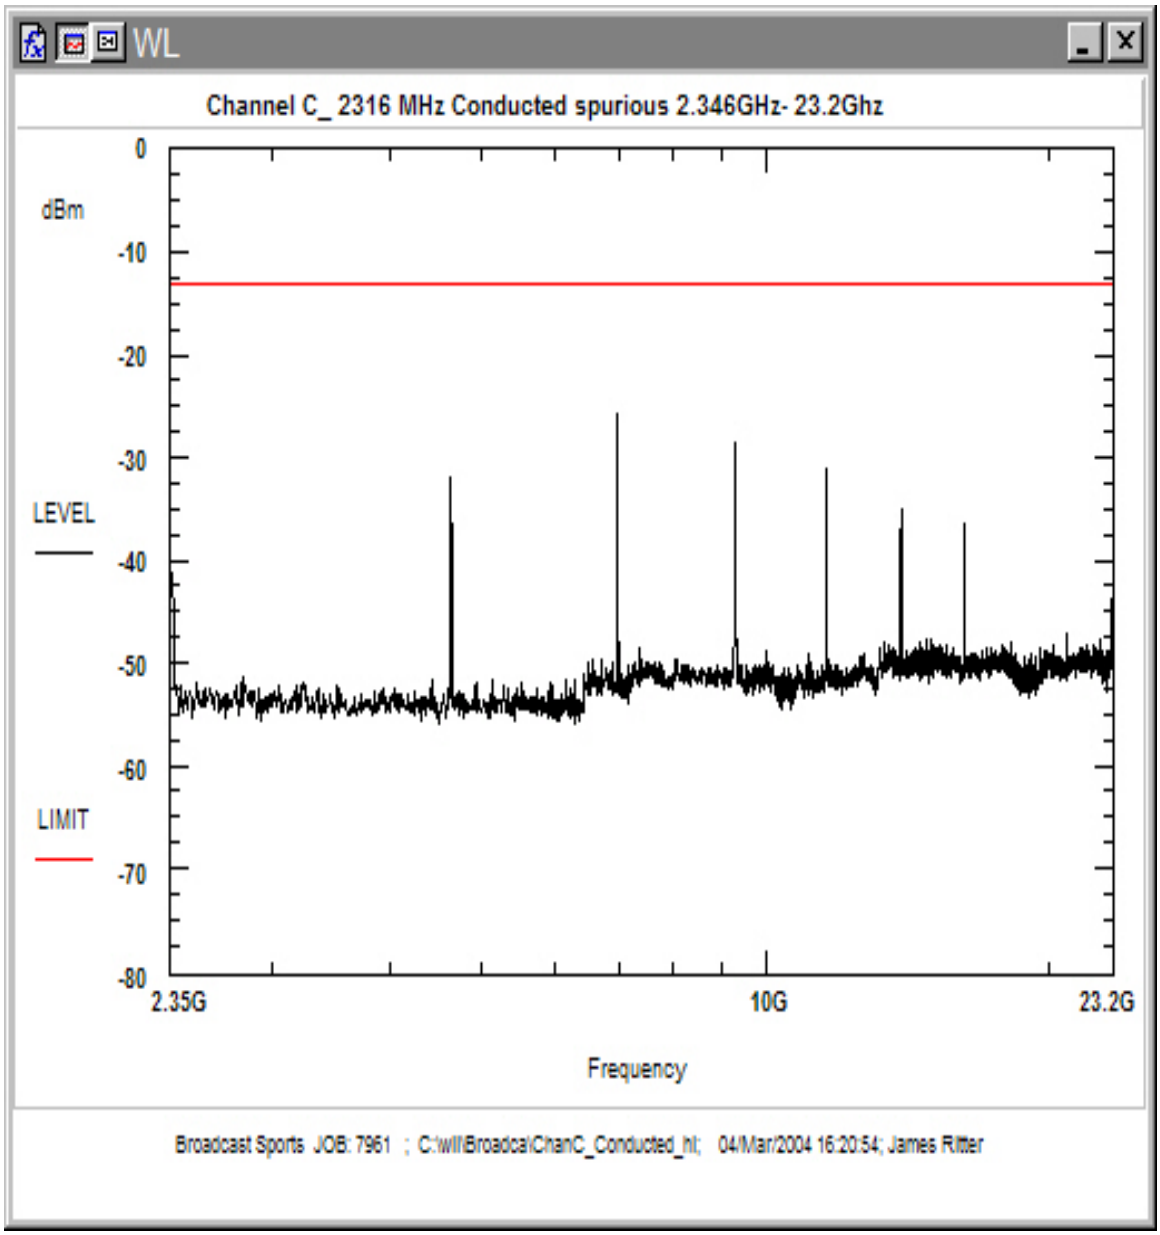

Figure 15. Emissions Mask, Channel 11

4.6 Radiated Spurious Emissions: (FCC Part §2.1053)

The EUT must comply with requirements for radiated spurious emissions.

4.6.1 Test Procedure

The EUT was placed on motorized turntable for radiated testing on a 3-meter open field test site. The emissions from the EUT were measured continuously at every azimuth by rotating the turntable. Receiving antennas were mounted on an antenna mast to determine the height of maximum emissions. The height of the antenna was varied between 1 and 4 meters. The peripherals were placed on the table in accordance with ANSI C63.4-2001. Cables were varied in position to produce maximum emissions. Both the horizontal and vertical field components were measured.

The Effective Isotropic Radiated Power (EIRP) levels were measured and compared with the limit of –13 dBm per FCC Part 74. The limit of -13dB is derived from the formula of 43+10LOG(P) dB per §74637(a)(3).

Emissions were measured for Channel 1, Channel 8 and Channel 11 and are reported in the following tables. Emissions were scanned up to the 10^{th} harmonic of the fundamental. No emissions were detected above 18GHz. The signal substitution method was used to obtain EIRP levels.

4.7 Frequency Stability: (FCC Part §2.1055)

Frequency as a function of temperature and voltage variation shall be maintained within the FCC-prescribed tolerances.

The temperature stability was measured with the unit in an environmental chamber used to vary the temperature of the sample. The sample was held at each temperature step to allow the temperature of the sample to stabilize.

The EUT is powered by DC voltage supplied externally. The manufacturer's power requirements for the EUT include the following:

Low DC Voltage of 11 VDC (manufacturer's specification)

High DC Voltage of 13.8 VDC (manufacturer's specifications)

The frequency stability of the transmitter was examined at the voltage extremes and for the temperature range of -30°C to +50°C. The carrier frequency was measured while the EUT was in the temperature chamber. The reference frequency of the EUT was measured at the ambient room temperature with the frequency counter. The following are the reference frequencies at ambient for the High channel.

High Channel: 2316MHz
