## 1 APPLIED STANDARDS AND TEST SUMMARY

### 1.1 APPLIED STANDARDS

#### **Type of Authorization**

Certification for an Intentional Radiator (Periodic operation in the band above 70 MHz)

#### **Applicable FCC Rules**

Edition of FCC Rules: October 1, 2015

Prepared in accordance with the requirements of FCC Rules and Regulations as listed in 47 CFR Ch.1 Parts 2 and 15. The following subparts are applicable to the results in this test report.

Part 2, Subpart J - Equipment Authorization Procedures, Certification

Part 15, Subpart C – Intentional Radiators

§ 15.201 Equipment authorization requirement

§ 15.207 Conducted limits

§ 15.209 Radiated emission limits; general requirements

§ 15.231 Periodic operation in the band 40.66-40.70 MHz, above 70 MHz

Note:

ANSI C63.10 2013 was applied

#### **Summary Test Results:**

**The EUT complied with all performed tests as listed in chapter 1.3 Measurement Summary / Signatures.**

## 1.2 FCC-IC CORRELATION TABLE

Correlation of measurement requirements for Momentarily (incl. Periodically) Operated Devices and Remote Control from FCC and IC

### Radio equipment

Measurement	FCC reference	IC reference
Conducted emissions on AC Mains	§ 15.207	RSS-Gen Issue 5: 8.8
Transmitter spurious radiated emissions	§ 15.231 (b) / (e)	RSS Gen Issue 5: 6.10/6.13/8.9/8.10; RSS-210 Issue 9: A1.1.2, A1.1.5
Duty cycle measurement (based on dwell time measurement)	§ 15.231 (a)	RSS-210 Issue 9: A1.1.1, A1.1.5
Maximum radiated field strength at fundamental frequency	§ 15.231 (b) / (e)	RSS-210 Issue 9: A1.1.2, A1.1.5; RSS Gen Issue 5: 6.12
Occupied bandwidth	§ 15.231 (c)	RSS-210 Issue 9: A1.1.3
Frequency Stability	§ 15.231 (d)	RSS-210 Issue 9: A1.1.4
Antenna requirement	§ 15.203 / 15.204	RSS-Gen Issue 5: 8.3
Receiver spurious emissions	-	RSS-210 Issue 9: 2.3 RSS Gen Issue 5: 5/7 *)

\*) Receivers are exempted from certification besides if operating in stand-alone mode in the frequency range 30–960 MHz or if these are scanner receivers.

1.3 MEASUREMENT SUMMARY /SIGNATURES

**FCC Part 15, Subpart C § 15.231**

Duty cycle measurement (based on dwell time measurement)  
The measurement was performed according to ANSI C63.10

OP-Mode	Setup	Port	2013 Final Result
op-mode 3	Setup_AB01	Enclosure	passed
op-mode 4	Setup_AB01	Enclosure	passed

**FCC Part 15, Subpart C § 15.231**

Spurious Radiated Emissions  
The measurement was performed according to ANSI C63.10

OP-Mode	Setup	Port	2013 Final Result
op-mode 1	Setup_AA01	Enclosure	passed
op-mode 2	Setup_AA01	Enclosure	passed

**FCC Part 15, Subpart C § 15.231**

Maximum radiated field strength at fundamental frequency  
The measurement was performed according to ANSI C63.10

OP-Mode	Setup	Port	2013 Final Result
op-mode 1	Setup_AA01	Enclosure	passed
op-mode 2	Setup_AA01	Enclosure	passed

**FCC Part 15, Subpart C § 15.231**

Occupied Bandwidth  
The measurement was performed according to ANSI C63.10

## 2 ADMINISTRATIVE DATA

### 2.1 TESTING LABORATORY

Company Name: 7layers GmbH  
Address: Borsigstr. 11  
40880 Ratingen  
Germany

This facility has been fully described in a report submitted to the ISED and accepted under the registration number: Site# 3699A-1.

The test facility is also accredited by the following accreditation organisation:

Laboratory accreditation no: DAKKS D-PL-12140-01-00  
FCC Designation Number: DE0015  
FCC Test Firm Registration: 929146  
Responsible for accreditation scope: Dipl.-Ing. Marco Kullik  
Report Template Version: 2017-07-14

### 2.2 PROJECT DATA

Responsible for testing and report: B.Sc. Jens Dörwald  
Date of Report: 2019-02-04  
Testing Period: 2018-11-28 to 2019-01-28

### 2.3 APPLICANT DATA

Company Name: Jabil Circuit Belgium N.V.  
Address: Kempische Steenweg 297  
Industriezone Noord 1000/1920  
3500 Hasselt  
Belgium  
Contact Person: Mr. Kim Van Gelder

### 2.4 MANUFACTURER DATA

Company Name: Aptiv Service US LLC  
Address: 999 Republic Drive Suite 100  
Allen Park, MI 48101  
USA  
Contact Person: Mr. William Hynes

### 3 TEST OBJECT DATA

#### 3.1 GENERAL EUT DESCRIPTION

Kind of Device product description	OBDII Dongle, operating in 433 MHz frequency band
Product name	AMKC4J-14H092-AA
Type	-
<b>Declared EUT data by the supplier</b>	
Voltage Type	DC
Normal Voltage	13.0 V
Low Voltage	6.0 V
High Voltage	16.0 V
Normal Temperature	23 °C
Low Temperature	-20 °C
High Temperature	+55 °C
Specific product description for the EUT	The EUT is an OBD Dongle including Cellular technologies e.g. LTE, SRD RF-technologies and 2.4GHz WLAN. The operating frequency is 433 MHz.
The EUT provides the following ports:	Enclosure
Special software used for testing	The applicant provided a software to set the device in the different operating modes.

**The main components of the EUT are listed and described in Chapter 3.2.**

### 3.2 EUT MAIN COMPONENTS

Sample Name	Sample Code	Description
DE1102006 EUT A	aa01	radiated sample
Sample Parameter	Value	
Serial No.	1PD000MP	
HW Version	B1.6	
SW Version	Modem Firmware: SWI9X07Y_02.18.05.00 000000 jenkins 2018/07/19 17:40:21 Aurix Firmware: v0.87 Linux kernel : 3.2.6 Jabil_tools: 3.2.8

#### General description of ancillary equipment

Device	Details (Manufacturer, Type Model, OUT Code)	Reason for using
---	---	---

#### General description of auxiliary equipment

Device	Details (Manufacturer, HW, SW, S/N)	Description
---	---	---

## EUT SETUPS

This chapter describes the combination of EUTs and ancillary equipment used for testing.

Setup No.	Combination of EUTs	Description
Setup_AA01	EUT A	Setup for radiated measurements
Setup_AB01	EUT B	Setup for conducted measurements

## 3.3 OPERATING MODES

This chapter describes the operating modes of the EUTs used for testing.

Op. Mode	Description of Operating Modes	Remarks
op-mode 1	continuous modulated	EUT is transmitting a GFSK signal at 433.4 MHz (special op-mode for test purpose only)
op-mode 2	continuous modulated	EUT is transmitting a GFSK signal at 433.9 MHz (special op-mode for test purpose only)
op-mode 3	single pulse	EUT is transmitting a GFSK signal at 433.4 MHz
op-mode 4	single pulse	EUT is transmitting a GFSK signal at 433.9 MHz

## 3.4 PRODUCT LABELLING

### 3.4.1 FCC ID label

Please refer to the documentation of the applicant.

### 3.4.2 Location of the label on the EUT

Please refer to the documentation of the applicant.

## 4 TEST RESULTS

### 4.1 DUTY CYCLE MEASUREMENT (BASED ON DWELL TIME MEASUREMENT)

Standard **FCC Part 15 Subpart C**

**The test was performed according to:**  
ANSI C63.10

#### 4.1.1 TEST DESCRIPTION

The Equipment Under Test (EUT) was setup in a shielded room to perform the dwell time measurements. For analyzer settings please see measurement plots.

#### 4.1.2 TEST REQUIREMENTS / LIMITS

Depending on the function of the EUT different paragraphs of FCC §15.231 apply:

Either

(a)(1): A manually operated transmitter shall employ a switch that will automatically deactivate the transmitter within not more than 5 seconds of being released.

Or

(a)(2) A transmitter activated automatically shall cease transmission within 5 seconds after activation.

And

(a)(3) Periodic transmissions at regular predetermined intervals are not permitted. However, polling or supervision transmissions, including data, to determine system integrity of transmitters used in security or safety applications are allowed if the total duration of transmissions does not exceed more than two seconds per hour for each transmitter. There is no limit on the number of individual transmissions, provided the total transmission time does not exceed two seconds per hour.

Otherwise

(e) Intentional radiators may operate at a periodic rate exceeding that specified in paragraph (a) of this section and may be employed for any type of operation [...]. In addition, [...] the duration of each transmission shall not be greater than one second and the silent period between transmissions shall be at least 30 times the duration of the transmission but in no case less than 10 seconds.

#### 4.1.1.3 TEST PROTOCOL

Temperature: 23 °C  
 Air Pressure: 1009 hPa  
 Humidity: 38 %

Op. Mode	Setup	Port
op-mode 3	Setup_AB01	Enclosure

a) Determine the total duration of a transmission within 100 ms:

Duty cycle =  $((L1*N1) + (L2*N2) + \dots + (Ln*Ln)) / 100 \text{ ms}$  or T, whichever is less  
 Correction factor =  $20 * \text{LOG} (\text{Duty cycle})$  [dB]

Step 1	Holdover time	Less than 5s
Step 2	Cycle to determine the on/off ratio within a cycle (period T)	100 ms
Step 3	Sweep of a data word to determine the on time within a data word (L1-LN)	L = 1.0624 ms
Step 4	Determine the number of pulses (N). First range (trigger delay = 0 ms).	N = 1

Calculation of Duty Cycle / Correction Factor:

If  $T > 100 \text{ ms} \Rightarrow T = 100 \text{ ms}$ ;  $L = 1.0624 \text{ ms}$ ;  $N = 1$   
 In 100 ms  $T_{\text{on}} = (1*1.0624) / 100 = 0.010624$

CORRECTION FACTOR =  $20 * \text{LOG} (0.010624) = -39.47 \text{ dB}$

b) Determine the period of periodic re-transmission, if any, or cease (deactivation) time:

No period of retransmission found

Deactivation after  $T_c \approx 1.0624 \text{ ms}$ , Limit:  $\leq 5 \text{ s}$

c) Determine the total duration of periodic transmissions within 1 hour, if any:

Duration  $t_d$  of all pulses/bursts during  $T_R$  ("on-time"):

$t_d$  depends on the number of the button pressing.  
 On each pressing, the  $t_d \approx 1.0624 \text{ ms}$ .

d) If the result of c) exceeds 2 seconds/hour then paragraph (e) applies:

Determine the duration of each transmission (one complete pulse train) and silent time:

Duration  $t_{PT}$ , Limit:  $\leq 1 \text{ s}$  (Remark:  $t_{PT}$  is identical to  $t_d$  if  $T \leq 100 \text{ ms}$ )

Silent time between transmissions  $t_s = N/A$ , Limit:  $\leq \text{Maximum} (10 \text{ s and } 30*t_{PT})$ .

Op. Mode	Setup	Port
op-mode 4	Setup_AB01	Enclosure

a) Determine the total duration of a transmission within 100 ms:

Duty cycle =  $((L1*N1) + (L2*N2) + \dots + (Ln*Ln)) / 100 \text{ ms}$  or T, whichever is less  
 Correction factor =  $20 * \text{LOG} (\text{Duty cycle})$  [dB]

Step 1	Holdover time	Less than 5s
Step 2	Cycle to determine the on/off ratio within a cycle (period T)	100 ms
Step 3	Sweep of a data word to determine the on time within a data word (L1-LN)	L = 3.85 ms
Step 4	Determine the number of pulses (N). First range (trigger delay = 0 ms).	N = 1

Calculation of Duty Cycle / Correction Factor:

If  $T > 100 \text{ ms} \Rightarrow T = 100 \text{ ms}$ ;  $L = 3.8477 \text{ ms}$ ;  $N = 1$

In 100 ms  $T_{on} = (1*3.85) / 100 = 0.0385$

CORRECTION FACTOR =  $20 * \text{LOG} (0.0385) = -28.3 \text{ dB}$

b) Determine the period of periodic re-transmission, if any, or cease (deactivation) time:

No period of retransmission found

Deactivation after  $T_c \approx 3.85 \text{ ms}$ , Limit:  $\leq 5 \text{ s}$

c) Determine the total duration of periodic transmissions within 1 hour, if any:

Duration  $t_d$  of all pulses/bursts during  $T_R$  ("on-time"):

$t_d$  depends on the number of the button pressing.

On each pressing, the  $t_d \approx 3.85 \text{ ms}$ .

d) If the result of c) exceeds 2 seconds/hour then paragraph (e) applies:

Determine the duration of each transmission (one complete pulse train) and silent time:

Duration  $t_{PT}$ , Limit:  $\leq 1 \text{ s}$  (Remark:  $t_{PT}$  is identical to  $t_d$  if  $T \leq 100 \text{ ms}$ )

Silent time between transmissions  $t_S = N/A$ , Limit:  $\leq \text{Maximum} (10 \text{ s and } 30*t_{PT})$ .

#### 4.1.4 TEST RESULT: DUTY CYCLE / CORRECTION FACTOR

FCC Part 15, Subpart C	Op. Mode	Result
	op-mode 3	passed
	op-mode 4	passed

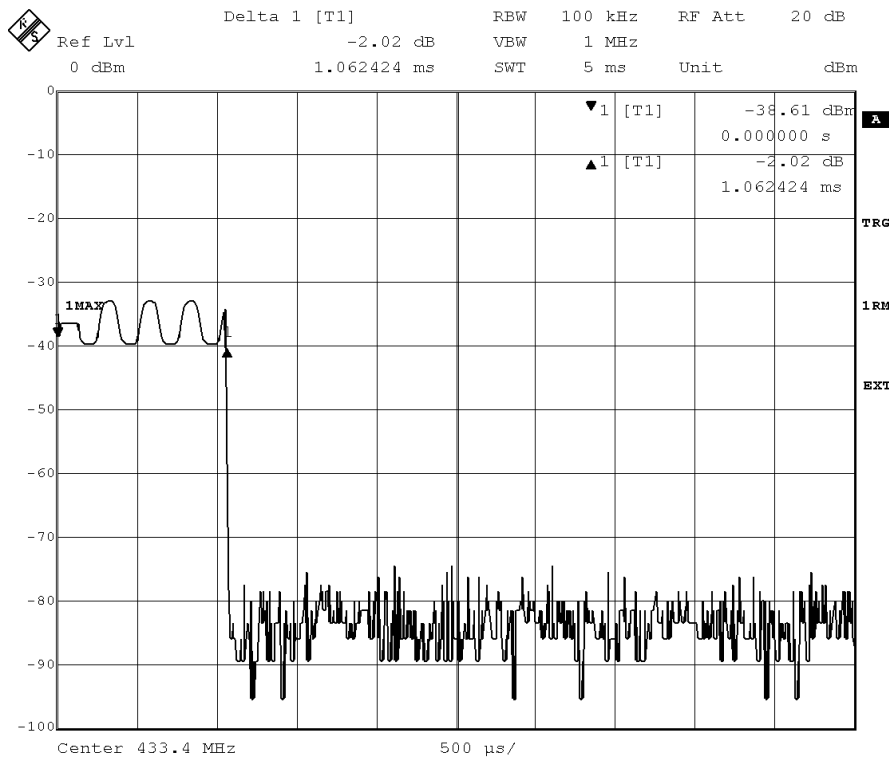

### 4.1.5 MEASUREMENT PLOTS DUTY CYCLE

op-mode 3

Date: 28.JAN.2019 12:32:27

The whole transmission after a single button pressing.

Date: 28.JAN.2019 12:30:32

Single pulse after a single button pressing.

op-mode 4:

	Delta 1 [T1]	RBW	100 kHz	RF Att	20 dB
Ref Lvl	-1.13 dB	VBW	1 MHz		
0 dBm	3.607214 ms	SWT	200 ms	Unit	dBm

Date: 28.JAN.2019 18:37:30

The whole transmission after a single button pressing.

	Delta 1 [T1]	RBW	100 kHz	RF Att	20 dB
Ref Lvl	1.85 dB	VBW	1 MHz		
0 dBm	3.847695 ms	SWT	5 ms	Unit	dBm

Date: 28.JAN.2019 18:39:58

Single pulse after a single button pressing.

## 4.2 SPURIOUS RADIATED EMISSIONS

Standard **FCC Part 15 Subpart C**

**The test was performed according to:**  
ANSI C63.10-2013

### 4.2.1 TEST DESCRIPTION

The test set-up was made in accordance to the general provisions of ANSI C63.10 in a typical installation configuration. The Equipment Under Test (EUT) was set up on a non-conductive table 1.0 x 2.0 m<sup>2</sup> in the semi-anechoic chamber. The influence of the EUT support table that is used between 30-1000 MHz was evaluated.

The measurement procedure is implemented into the EMI test software EMC32 from R&S. Exploratory tests are performed at 3 orthogonal axes to determine the worst-case orientation of a body-worn or handheld EUT. The final test on all kind of EUTs is also performed at 3 axes. A pre-check is performed while the EUT is powered from a DC power source.

#### 1. Measurement up to 30 MHz

The Loop antenna HFH2-Z2 is used.

##### Step 1: pre-measurement

- Anechoic chamber
- Antenna distance: 3 m
- Detector: Peak-Maxhold
- Frequency range: 0.009 - 0.15 MHz and 0.15 - 30 MHz
- Frequency steps: 0.05 kHz and 2.25 kHz
- IF-Bandwidth: 0.2 kHz and 9 kHz
- Measuring time / Frequency step: 100 ms (FFT-based)

Intention of this step is, to determine the radiated EMI-profile of the EUT. Afterwards the relevant emissions for the final measurement are identified.

##### Step 2: final measurement

For the relevant emissions determined in step 1, an additional measurement with the following settings will be performed. Intention of this step is to find the maximum emission level.

- Open area test side
- Antenna distance: according to the Standard
- Detector: Quasi-Peak
- Frequency range: 0.009 - 30 MHz
- Frequency steps: measurement at frequencies detected in step 1
- IF-Bandwidth: 0.2 - 10 kHz
- Measuring time / Frequency step: 1 s

#### 2. Measurement above 30 MHz and up to 1 GHz

##### Step 1: Preliminary scan

This is a preliminary test to identify the highest amplitudes relative to the limit.

Settings for step 1:

- Antenna distance: 3 m
- Detector: Peak-Maxhold / Quasipeak (FFT-based)
- Frequency range: 30 - 1000 MHz
- Frequency steps: 30 kHz

- IF-Bandwidth: 120 kHz
- Measuring time / Frequency step: 100 ms
- Turntable angle range:  $-180^{\circ}$  to  $90^{\circ}$
- Turntable step size:  $90^{\circ}$
- Height variation range: 1 – 3 m
- Height variation step size: 2 m
- Polarisation: Horizontal + Vertical

Intention of this step is, to determine the radiated EMI-profile of the EUT. Afterwards the relevant emissions for the final measurement are identified.

### Step 2: Adjustment measurement

In this step the accuracy of the turntable azimuth and antenna height will be improved. This is necessary to find out the maximum value of every frequency.

For each frequency, which was determined the turntable azimuth and antenna height will be adjusted. The turntable azimuth will slowly vary by  $\pm 45^{\circ}$  around this value. During this action, the value of emission is continuously measured. The turntable azimuth at the highest emission will be recorded and adjusted. In this position, the antenna height will also slowly vary by  $\pm 100$  cm around the antenna height determined. During this action, the value of emission is also continuously measured. The antenna height of the highest emission will also be recorded and adjusted.

- Detector: Peak – Maxhold
- Measured frequencies: in step 1 determined frequencies
- IF – Bandwidth: 120 kHz
- Measuring time: 100 ms
- Turntable angle range:  $\pm 45^{\circ}$  around the determined value
- Height variation range:  $\pm 100$  cm around the determined value
- Antenna Polarisation: max. value determined in step 1

### Step 3: Final measurement with QP detector

With the settings determined in step 3, the final measurement will be performed:

EMI receiver settings for step 4:

- Detector: Quasi-Peak ( $< 1$  GHz)
- Measured frequencies: in step 1 determined frequencies
- IF – Bandwidth: 120 kHz
- Measuring time: 1 s

After the measurement a plot will be generated which contains a diagram with the results of the preliminary scan and a chart with the frequencies and values of the results of the final measurement.

## 3. Measurement above 1 GHz

The following modifications apply to the measurement procedure for the frequency range above 1 GHz:

### Step 1:

The Equipment Under Test (EUT) was set up on a non-conductive support (tilt device) at 1.5 m height in the fully-anechoic chamber.

All steps were performed with one height of the receiving antenna only.

The EUT is turned during the preliminary measurement across the elevation axis, with a step size of  $90^{\circ}$ .

The turn table step size (azimuth angle) for the preliminary measurement is  $45^{\circ}$ .

### Step 2:

Due to the fact, that in this frequency range the test is performed in a fully anechoic room, the height scan of the receiving antenna instep 2 is omitted. Instead of this, a maximum search with a step size  $\pm 45^{\circ}$  for the elevation axis is performed.

The turn table azimuth will slowly vary by  $\pm 22.5^{\circ}$ .

The elevation angle will slowly vary by  $\pm 45^{\circ}$

EMI receiver settings (for all steps):

- Detector: Peak, Average
- IF Bandwidth = 1 MHz

**Step 3:**

Spectrum analyser settings for step 3:

- Detector: Peak / Average
- Measured frequencies: in step 1 determined frequencies
- IF – Bandwidth: 1 MHz
- Measuring time: 1 s

4.2.2 TEST REQUIREMENTS / LIMITS

FCC Part 15, Subpart C, §15.247 (d)

... In addition, radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a) (see Section 15.205(c)).

FCC Part 15, Subpart C, §15.209, Radiated Emission Limits

Frequency in MHz	Limit (µV/m)	Measurement distance (m)	Calculate Limit (dBµV/m @10m)	Limit (dBµV/m) @10m
0.009 – 0.49	2400/F (kHz)	300	(48.5 – 13.8) + 59.1 dB	107.6 – 72.9
0.49 – 1.705	24000/F (kHz)	30	(33.8 – 23.0) + 19.1 dB	52.9 – 42.1
1.705 – 30	30	30	29.5 + 19.1 dB	39.5

Frequency in MHz	Limit (µV/m)	Measurement distance (m)	Limit (dBµV/m)
30 – 88	100	3	40.0
88 – 216	150	3	43.5
216 – 960	200	3	46.0
above 960	500	3	54.0

§15.35(b)

..., there is also a limit on the radio frequency emissions, as measured using instrumentation with a peak detector function, corresponding to 20 dB above the maximum permitted average limit....

Used conversion factor:  $\text{Limit (dB}\mu\text{V/m)} = 20 \log (\text{Limit } (\mu\text{V/m})/1\mu\text{V/m)}$

§15.35(b) ..., there is also a limit on the radio frequency emissions, as measured using instrumentation with a peak detector function, corresponding to 20 dB above the maximum permitted average limit ...

Used conversion factor:  $\text{Limit (dB}\mu\text{V/m)} = 20 \log (\text{Limit } (\mu\text{V/m})/1\mu\text{V/m)}$

§15.35(c):

[...] when the radiated emission limits are expressed in terms of the average value of the emission, and pulsed operation is employed, the measurement field strength shall be determined by averaging over one complete pulse train, including blanking intervals, as long as the pulse train does not exceed 0.1 seconds.

As an alternative (provided the transmitter operates for longer than 0.1 seconds) or in cases where the pulse train exceeds 0.1 seconds, the measured field strength shall be determined from the average absolute voltage during a 0.1 second interval during which the field strength is at its maximum value. The exact method of calculating the average field strength shall be submitted [...].

§15.231(b)(3)

The limits on the field strength of the spurious emissions in the above table are based on the fundamental frequency of the intentional radiator.

Spurious emissions shall be attenuated to the average (or, alternatively, CISPR quasi-peak) limits shown in this table or to the general limits shown in §15.209, whichever limit permits a higher field strength.

Interpretation of the test laboratory:

The last subordinate clause of §15.231(b)(3) is overruled by §15.205/209, therefore within the restricted bands the limits defined at §15.205/209 and outside the restricted bands the limits defined at §15.231(b) resp. §15.231(e) are applied.

#### 4.2.3 TEST PROTOCOL

##### 4.2.3.2 MEASUREMENT ABOVE 30 MHZ TO 6 GHZ

Temperature: 24 °C  
 Air Pressure: 1006 hPa  
 Humidity: 32 %

Setup\_AA01  
 op-mode1

Spurious Freq. [MHz]	Spurious Level [dBµV/m]	Detector	RBW [kHz]	Limit [dBµV/m]	Margin to Limit [dB]
192.0	19.22	QP	120	60.8	41.58
240.0	37.83	QP	120	60.8	8.17
867.2	39.77	QP	120	60.8	21.03

Setup\_AA01  
 op-mode2

Spurious Freq. [MHz]	Spurious Level [dBµV/m]	Detector	RBW [kHz]	Limit [dBµV/m]	Margin to Limit [dB]
240.0	21.65	QP	120	46.0	39.15
867.9	38.36	QP	120	60.8	22.44

Remarks: - No more spurious emissions in the range 15 dB below the limit were found.  
 The test was performed in the frequency range from 30 MHz to 1 GHz. For this test the EUT was sending a continuously modulated signal.  
 - No Duty Cycle correction factor was used.  
 - Please see the measurement plot.  
 - wanted signal at 433.4 MHz  
 - wanted signal at 433.9 MHz

#### 4.2.4 MEASUREMENT PLOTS

##### 4.2.4.1 RADIATED EMISSIONS (f < 30 MHz)

#### 4.4 OCCUPIED BANDWIDTH

Standard **FCC Part 15 Subpart C**

**The test was performed according to:**  
ANSI C63.10-2013

##### 4.4.1 TEST DESCRIPTION

The Equipment Under Test (EUT) was setup in a shielded room to perform the occupied bandwidth measurements.

For analyzer settings please see the measurement plots.

##### 4.4.2 TEST LIMITS

FCC Part 15, Subpart C, §15.231(c)

The maximum 20 dB bandwidth of a transmitter operating at a frequency range:

70 to 900 MHz is 0.25% of the centre frequency

above 900 MHz is 0.5% of the centre frequency

##### 4.4.3 TEST PROTOCOL

Temperature: 23 °C  
Air Pressure: 1009 hPa  
Humidity: 42 %

Op. Mode	Setup	Port
op-mode 1	Setup_AB01	Enclosure

Cannel Frequency [MHz]	20 dB bandwidth [kHz]	99% bandwidth [kHz]	Limit [kHz]
433.4	62.12	56.12	108.25

Op. Mode	Setup	Port
op-mode 2	Setup_AB01	Enclosure

Cannel Frequency [MHz]	20 dB bandwidth [kHz]	99% bandwidth [kHz]	Limit [kHz]
433.9	66.13	56.11	108.25

Remark: Please see the measurement plots.

##### 4.4.4 TEST RESULT: OCCUPIED BANDWIDTH

FCC Part 15, Subpart C	Op. Mode	Result
	op-mode 1	passed
	op-mode 2	passed

#### Sample calculation

$$E \text{ (dB } \mu\text{V/m)} = U \text{ (dB } \mu\text{V)} + \text{AF (dB 1/m)} + \text{Corr. (dB)}$$

U = Receiver reading

AF = Antenna factor

Corr. = sum of single correction factors of used cables, switch unit, distance correction, amplifier (if applicable)

distance correction =  $-40 * \text{LOG} (d_{\text{Limit}} / d_{\text{used}})$

Linear interpolation will be used for frequencies in between the values in the table.

Table shows an extract of values

### Sample calculation

$$E \text{ (dB } \mu\text{V/m)} = U \text{ (dB } \mu\text{V)} + \text{AF (dB 1/m)} + \text{Corr. (dB)}$$

U = Receiver reading

AF = Antenna factor

Corr. = sum of single correction factors of used cables, switch unit, distance correction, amplifier (if applicable)

distance correction =  $-20 * \text{LOG} (d_{Limit} / d_{used})$

Linear interpolation will be used for frequencies in between the values in the table.

Tables show an extract of values.

### 6.3 ANTENNA R&S HF907 (1 GHZ – 18 GHZ)

Frequency	AF R&S HF907	Corr.
MHz	dB (1/m)	dB
1000	24.4	-19.4
2000	28.5	-17.4
3000	31.0	-16.1
4000	33.1	-14.7
5000	34.4	-13.7
6000	34.7	-12.7
7000	35.6	-11.0

cable loss 1 (relay + cable inside chamber)	cable loss 2 (outside chamber)	cable loss 3 (switch unit, attenuator & pre-amp)	cable loss 4 (to receiver)		
dB	dB	dB	dB		
0.99	0.31	-21.51	0.79		
1.44	0.44	-20.63	1.38		
1.87	0.53	-19.85	1.33		
2.41	0.67	-19.13	1.31		
2.78	0.86	-18.71	1.40		
2.74	0.90	-17.83	1.47		
2.82	0.86	-16.19	1.46		

Frequency	AF R&S HF907	Corr.
MHz	dB (1/m)	dB
3000	31.0	-23.4
4000	33.1	-23.3
5000	34.4	-21.7
6000	34.7	-21.2
7000	35.6	-19.8

cable loss 1 (relay inside chamber)	cable loss 2 (inside chamber)	cable loss 3 (outside chamber)	cable loss 4 (switch unit, attenuator & pre-amp)	cable loss 5 (to receiver)	used for FCC 15.247
dB	dB	dB	dB	dB	
0.47	1.87	0.53	-27.58	1.33	
0.56	2.41	0.67	-28.23	1.31	
0.61	2.78	0.86	-27.35	1.40	
0.58	2.74	0.90	-26.89	1.47	
0.66	2.82	0.86	-25.58	1.46	

Frequency	AF R&S HF907	Corr.
MHz	dB (1/m)	dB
7000	35.6	-57.3
8000	36.3	-56.3
9000	37.1	-55.3

#### Sample calculation

$$E \text{ (dB } \mu\text{V/m)} = U \text{ (dB } \mu\text{V)} + \text{AF (dB 1/m)} + \text{Corr. (dB)}$$

U = Receiver reading

AF = Antenna factor

Corr. = sum of single correction factors of used cables, switch unit, distance correction, amplifier (if applicable)

Linear interpolation will be used for frequencies in between the values in the table.

Tables show an extract of values.

## 7 PHOTO REPORT

Photos are included in an external report.

## 8 SETUP DRAWINGS

Remark: Depending on the frequency range suitable antenna types, attenuators or preamplifiers are used.

**Drawing 1:** Setup in the Anechoic chamber. For measurements below 1 GHz the ground was replaced by a conducting ground plane.
