RE: Axonn Corp.  
FCC ID: FCC ID L2VAX550

I am in receipt of the response letter of May 31, 2001. The explanation provided is sufficient for my RF shielding question. I still have some concerns about data buffering. The big test for this is what would happen in an over-modulated condition.

- 1.) Please describe what effect if any will occur to the transmitted emission envelope with unusually high input signal levels. As an example, if the equipment is designed to accept a 1V p-p input data stream, what will happen if the input signal is increased to 10V p-p?
- 2.) Please describe what effect if any will occur to the transmitted emission envelope with unusually fast input data rates. As an example, if the maximum design data rate is 9600bps, what will happen if the serial input to the device is increased to 19,200bps?
