APPENDIX A: SAR DISTRIBUTION COMPARISON FOR THE ACCURACY
VERIFICATION

Document		Page
APPENDIX A-E: SAR PLOTS, PROBE, DIPOLE CALIBRATION DATA & SET-UP PHOTOS		2(45)
Dates of Test		Test Report No
Nov. 27 - Dec. 06, 2002		RIM-0001-0301-04
Jan. 06 – 07, 2003		FCC ID:
		L6AR6120CN

11/27/02

Dipole 835

SAM 2; Flat

Probe: ET3DV6 - SN1644; ConvF(6.60,6.60,6.60); Crest factor: 1.0; Head 835 MHz; $\sigma = 0.89 \text{ mho/m}$ $\epsilon_r = 40.6$ $\rho = 1.00 \text{ g/cm}^3$

Cube 5x5x7: Peak: 17.2 mW/g, SAR (1g): 10.6 mW/g, SAR (10g): 6.71 mW/g, (Worst-case extrapolation)

Penetration depth: 11.6 (10.3, 13.4) [mm]

Powerdrift: -0.03 dB

Date: November 27, 2002

Ambient temperature: 24.2 deg. cel.

Liquid temperature: 23.3 deg. cel.

Calibration Certificate

Dosimetric E-Field Probe

Type:

ET3DV6

Serial Number:

1644

Place of Calibration:

Zurich

Date of Calibration:

October 21, 2002

Calibration Interval:

12 months

Schmid & Partner Engineering AG hereby certifies, that this device has been calibrated on the date indicated above. The calibration was performed in accordance with specifications and procedures of Schmid & Partner Engineering AG.

Wherever applicable, the standards used in the calibration process are traceable to international standards. In all other cases the standards of the Laboratory for EMF and Microwave Electronics at the Swiss Federal Institute of Technology (ETH) in Zurich, Switzerland have been applied.

Calibrated by:

N. Vetter

Approved by:

Alain Kopf

Calibration Certificate

835 MHz System Validation Dipole

Type:	D835V2
Serial Number:	446
Place of Calibration:	Zurich
Date of Calibration:	November 12, 2001
Calibration Interval:	24 months

Schmid & Partner Engineering AG hereby certifies, that this device has been calibrated on the date indicated above. The calibration was performed in accordance with specifications and procedures of Schmid & Partner Engineering AG.

Wherever applicable, the standards used in the calibration process are traceable to international standards. In all other cases the standards of the Laboratory for EMF and Microwave Electronics at the Swiss Federal Institute of Technology (ETH) in Zurich, Switzerland have been applied.

Dates of Test		Test Report No
Nov. 27 - Dec. 06, 2002		RIM-0001-0301-04
Jan. 06 - 07, 2003		FCC ID:
		L6AR6120CN

1. Measurement Conditions

The measurements were performed in the flat section of the new generic twin phantom filled with head simulating solution of the following electrical parameters at 835 MHz:

Relative Dielectricity	42.3	± 5%
Conductivity	0.91 mho/m	± 5%

The DASY3 System (Software version 3.1c) with a dosimetric E-field probe ET3DV6 (SN:1507, Conversion factor 6.27 at 900 MHz) was used for the measurements.

The dipole was mounted on the small tripod so that the dipole feedpoint was positioned below the center marking of the flat phantom section and the dipole was oriented parallel to the body axis (the long side of the phantom). The standard measuring distance was 15mm from dipole center to the solution surface. The included distance holder was used during measurements for accurate distance positioning.

The coarse grid with a grid spacing of 20mm was aligned with the dipole. The 5x5x7 fine cube was chosen for cube integration. Probe isotropy errors were cancelled by measuring the SAR with normal and 90° turned probe orientations and averaging. The dipole input power (forward power) was 250mW ± 3%. The results are normalized to 1W input power.

2. SAR Measurement

Standard SAR-measurements were performed with the phantom according to the measurement conditions described in section 1. The results have been normalized to a dipole input power of 1W (forward power). The resulting averaged SAR-values are:

averaged over 1 cm ³ (1 g) of tissue:	10.7 mW/g
averaged over 10 cm ³ (10 g) of tissue:	6.84 mW/g

Note: If the liquid parameters for validation are slightly different from the ones used for initial calibration, the SAR-values will be different as well.

Jan. 06 - 07, 2003	FCC ID:	
	L6AR6120CN	

3. Dipole Impedance and Return Loss

The impedance was measured at the SMA-connector with a network analyzer and numerically transformed to the dipole feedpoint. The transformation parameters from the SMA-connector to the dipole feedpoint are:

Electrical delay: 1.401 ns (one direction)
Transmission factor: 0.993 (voltage transmission, one direction)

The dipole was positioned at the flat phantom sections according to section 1 and the distance holder was in place during impedance measurements.

Feedpoint impedance at 835 MHz: $\text{Re}\{Z\} = 49.8 \Omega$
 $\text{Im}\{Z\} = -4.8 \Omega$
Return Loss at 835 MHz: -26.4 dB

4. Handling

Do not apply excessive force to the dipole arms, because they might bend. Bending of the dipole arms stresses the soldered connections near the feedpoint leading to a damage of the dipole.

5. Design

The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals.

6. Power Test

After long term use with 100W radiated power, only a slight warming of the dipole near the feedpoint can be measured.

APPENDIX A-E: SAR PLOTS, PROBE, DIPOLE CALIBRATION DATA & SET-UP PHOTOS		36(45)
Dates of Test	Test Report No	
Nov. 27 - Dec. 06, 2002	RIM-0001-0301-04	
Jan. 06 - 07, 2003	FCC ID: L6AR6120CN	

1. Measurement Conditions

The measurements were performed in the flat section of the new generic twin phantom filled with brain simulating sugar solution of the following electrical parameters at 1900 MHz:

Relative permittivity	40.0	$\pm 5\%$
Conductivity	1.45 mho/m	$\pm 10\%$

The DASY3 System (Software version 3.1d) with a dosimetric E-field probe ET3DV6 (SN:1507, conversion factor 5.31 at 1800 MHz) was used for the measurements.

The dipole feedpoint was positioned below the center marking and oriented parallel to the body axis (the long side of the phantom). The standard measuring distance was 10mm from dipole center to the solution surface. The included distance holder was used during measurements for accurate distance positioning.

The coarse grid with a grid spacing of 20mm was aligned with the dipole. The 5x5x7 fine cube was chosen for cube integration. Probe isotropy errors were cancelled by measuring the SAR with normal and 90° turned probe orientations and averaging.

The dipole input power (forward power) was 250mW $\pm 3\%$. The results are normalized to 1W input power.

2. SAR Measurement

Standard SAR-measurements were performed with the head phantom according to the measurement conditions described in section 1. The results (see figure) have been normalized to a dipole input power of 1W (forward power). The resulting averaged SAR-values are:

averaged over 1 cm ³ (1 g) of tissue:	43.2 mW/g
averaged over 10 cm ³ (10 g) of tissue:	22.0 mW/g

Note: If the liquid parameters for validation are slightly different from the ones used for initial calibration, the SAR-values will be different as well. The estimated sensitivities of SAR-values and penetration depths to the liquid parameters are listed in the DASY Application Note 4: 'SAR Sensitivities'.
