## Justification of Step Size and Interpolation

This section demonstrates that a 5 mm step size with interpolation provides sufficient resolution for RF emissions measurements. The DASY 4 uses interpolation algorithms to derive 9 interpolated points between every measured point.

The figure above shows the raw measured field strength perpendicular to the length of the validation dipole. The TCB guidance slides require the 3 dB width to be much larger than the step size. The width between -3 dB points is $>21 \mathrm{~mm}$, at least 4 times the step size.

This figure shows the interpolated field strength perpendicular to the dipole. The interpolated points follow the raw points with no inconsistencies.

The green line in this figure shows the axis along which the points lie.

Comparison of 5 mm and 2 mm step sizes
An additional set of measurements was taken: dipole validations were performed using 5 mm and 2 mm step sizes. The delta between the two readings is insignificant for both field types ( $<0.4 \%$ for E and $0 \%$ for H ), demonstrating that 5 mm is sufficient. The plots follow.
