## 1 Description of the Equipment Under Test (EUT)

General data of EUT	
Type designation <sup>1</sup> :	FMR 6x
Variants covered by this report	
Serial number(s):	Prototype
Manufacturer:	Endress + Hauser GmbH + Co. KG
Type of equipment:	Level Probing Radar
Version:	As delivered
Additional parts/accessories:	N/A

Technical data of EUT	
Application frequency range:	75 - 85 GHz
Frequency range:	
Operating frequency:	79 - 83 GHz
Type of modulation:	FMCW
Number of RF-channels:	1
Channel spacing:	N/A
Designation of emissions <sup>2</sup> :	
Type of antenna:	Integrated
Size/length of antenna:	N/A
Connection of antenna:	<input type="checkbox"/> detachable <input checked="" type="checkbox"/> not detachable
Type of power supply:	DC supply
Specifications for power supply:	nominal voltage: 24 V minimum voltage: 10 V maximum voltage: 36 V  nominal frequency: DC Hz

SAR evaluation																																																																																																												
<p>SAR evaluation is required if the separation distance between the user and/or bystander and the antenna and/or radiating element of the device is less than or equal to 20 cm, except when the device operates at or below the applicable output power level (adjusted for tune-up tolerance) for the specified separation distance defined in the table.</p> <p>For controlled use devices where the 8 W/kg for 1 gram of tissue applies, the exemption limits for routine evaluation in the table are multiplied by a factor of 5. For limb-worn devices where the 10 gram value applies, the exemption limits for routine evaluation in the table are multiplied by a factor of 2.5. If the operating frequency of the device is between two frequencies located in the table, linear interpolation shall be applied for the applicable separation distance. For test separation distance less than 5 mm, the exemption limits for a separation distance of 5 mm can be applied to determine if a routine evaluation is required.</p> <p>For medical implants devices, the exemption limit for routine evaluation is set at 1 mW. <sup>5</sup> The exemption limit in the table are based on measurements and simulations on half-wave dipole antennas at separation distances of 5 mm to 25 mm from a flat phantom, providing a SAR value of approximately 0.4 W/kg for 1 g of tissue. For low frequencies (300 MHz to 835 MHz), the exemption limits are derived from alinear fit. For high frequencies (1900 MHz and above), the exemption limits are derived from athird order polynomial fit.

<sup>6</sup> Transmitters operating between 3 kHz and 10 MHz, meeting the exemption from routine SAR evaluation, shall demonstrate compliance to the instantaneous limits in IC RSS-102, issue 5, section 4.

	f = frequency in MHz * Plane-wave equivalent power density				

Spectral power density		Declared by applicant	Measured
Prediction <sup>8</sup> :	$S = P G / 4 \pi R^2$		
Where:	S = Power density P = Power input of antenna G = Power gain of the antenna relativ to an isotropic radiator R = Distance to the center of radiation of the antenna		
Maximum output power:	P = 1.334 W e.i.r.p.	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Antenna gain:	G = <i>Not applicable</i>	<input type="checkbox"/>	
Prediction distance:	R = 20 cm		
Power density at 20 cm:	<b>S = 0.265 mW/cm<sup>2</sup></b>		
Limit	<b>S<sub>lim</sub> = 1.0 mW/cm<sup>2</sup></b>		

Test Result:	Test passed

## 9 Revision History

Revision History			
<i>Edition</i>	<i>Date</i>	<i>Issued by</i>	<i>Modifications</i>
1	18 Nov 2016	J. Roidt	First Edition
2	2017-03-27	M. Steindl	Information about board of management and technical manager and updated. Inserted table of tested samples. Technical update of summary page. Re-evaluation of RF exposure.
3	2017-05-15	M. Steindl (lc)	Added estimation for human exposure to electromagnetic fields acc. to OET Bulletin 65.
