**Section 1: Overview**

**1.1 Test Summary**

The samples were assessed against the tests detailed in section 3 under the requirements of the following specifications:

| Specifications |
|----------------|
| CFR47 15.407   |

## Section 2: Assessment Information

### 2.1 General

This report contains an assessment of an apparatus against Radio Standards based upon tests carried out on the samples submitted. The testing was performed by and for the use of Cisco systems Inc:

With regard to this assessment, the following points should be noted:

- a) The results contained in this report relate only to the items tested and were obtained in the period between the date of the initial assessment and the date of issue of the report. Manufactured products will not necessarily give identical results due to production and measurement tolerances.
- b) The apparatus was set up and exercised using the configuration and modes of operation defined in this report only.
- c) Where relevant, the apparatus was only assessed using the susceptibility criteria defined in this report and the Test Assessment Plan (TAP).
- d) All testing was performed under the following environmental conditions:

|                      |                                      |
|----------------------|--------------------------------------|
| Temperature          | 15°C to 35°C (54°F to 95°F)          |
| Atmospheric Pressure | 860mbar to 1060mbar (25.4" to 31.3") |
| Humidity             | 10% to 75*%                          |
- e) All AC testing was performed at one or more of the following supply voltages:

|                     |
|---------------------|
| 110V 60 Hz (+/-20%) |
|---------------------|

### 2.2 Units of Measurement

The units of measurements defined in the appendices are reported in specific terms, which are test dependent. Where radiated measurements are concerned these are defined at a particular distance. Basic voltage measurements are defined in units of [dBuV]

As an example, the basic calculation for all measurements is as follows:

$$\text{Emission level [dBuV]} = \text{Indicated voltage level [dBuV]} + \text{Cable Loss [dB]} + \text{Other correction factors [dB]}$$

The combinations of correction factors are dependent upon the exact test configurations [see test equipment lists for further details] and may include:-

Antenna Factors, Pre Amplifier Gain, LISN Loss, Pulse Limiter Loss and Filter Insertion Loss..

Note: to convert the results from dBuV/m to uV/m use the following formula:-

$$\text{Level in uV/m} = \text{Common Antilogarithm} [(X \text{ dBuV/m})/20] = Y \text{ uV/m}$$

### Measurement Uncertainty Values

|                                   |                         |
|-----------------------------------|-------------------------|
| voltage and power measurements    | $\pm 2$ dB              |
| conducted EIRP measurements       | $\pm 1.4$ dB            |
| radiated measurements             | $\pm 3.2$ dB            |
| frequency measurements            | $\pm 2.4 \cdot 10^{-7}$ |
| temperature measurements          | $\pm 0.54^\circ$        |
| humidity measurements             | $\pm 2.3\%$             |
| DC and low frequency measurements | $\pm 2.5\%$             |

Where relevant measurement uncertainty levels have been estimated for tests performed on the apparatus. This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of  $k=2$ .

#### Radiated emissions (expanded uncertainty, confidence interval 95%)

|                    |            |
|--------------------|------------|
| 30 MHz - 300 MHz   | +/- 3.8 dB |
| 300 MHz - 1000 MHz | +/- 4.3 dB |
| 1 GHz - 10 GHz     | +/- 4.0 dB |
| 10 GHz - 18GHz     | +/- 8.2 dB |
| 18GHz - 26.5GHz    | +/- 4.1 dB |
| 26.5GHz - 40GHz    | +/- 3.9 dB |

#### Conducted emissions (expanded uncertainty, confidence interval 95%)

|                |             |
|----------------|-------------|
| 30 MHz – 40GHz | +/- 0.38 dB |
|----------------|-------------|

A product is considered to comply with a requirement if the nominal measured value is below the limit line. The product is considered to not be in compliance in case the nominal measured value is above the limit line.

**This report must not be reproduced except in full, without written approval of Cisco Systems.**

**2.3 Date of testing (initial sample receipt date to last date of testing)**

27-JUN-2017 to 19-APR-2018

**2.4 Report Issue Date**

Cisco uses an electronic system to issue, store and control the revision of test reports. This system is called the Engineering Document Control System (EDCS). The actual report issue date is embedded into the original file on EDCS. Any copies of this report, either electronic or paper, that are not on EDCS must be considered uncontrolled

**2.5 Testing facilities**

This assessment was performed by:

**Testing Laboratory**

Cisco Systems, Inc.  
125 West Tasman Drive (Building P)  
San Jose, CA 95134  
USA

**Headquarters**

Cisco Systems, Inc.,

**2.6 Equipment Assessed (EUT)**

C1111-4PW with ISR-AP1100AC-B

## 2.7 EUT Description

The Cisco ISR-AP1100AC Wi-Fi module supports the following modes of operation. The modes are further defined in the radio Theory of Operation. The modes included in this report represent the worst case data for all modes.

- 802.11a - Non HT20, One Antenna, 6 to 54 Mbps, 1ss
- 802.11a - Non HT20, Two Antennas, 6 to 54 Mbps, 1ss
  
- 802.11a - Non HT20 Beam Forming, Two Antennas, 6 to 54 Mbps, 1ss
  
- 802.11n/ac - HT/VHT20, One Antenna, M0 to M7, 1ss
- 802.11n/ac - HT/VHT20, Two Antennas, M0 to M7, 1ss
- 802.11n/ac - HT/VHT20, Two Antennas, M8 to M15, 2ss
  
- 802.11n/ac - HT/VHT20 Beam Forming, Two Antennas, M0 to M7, 1ss
- 802.11n/ac - HT/VHT20 Beam Forming, Two Antennas, M8 to M15, 2ss
  
- 802.11n/ac - HT/VHT20 STBC, Two Antennas, M0 to M7, 2ss
  
- 802.11a - Non HT40, One Antenna, 6 to 54 Mbps, 1ss
- 802.11a - Non HT40, Two Antennas, 6 to 54 Mbps, 1ss
  
- 802.11n/ac - HT/VHT40, One Antenna, M0 to M7, 1ss
- 802.11n/ac - HT/VHT40, Two Antennas, M0 to M7, 1ss
- 802.11n/ac - HT/VHT40, Two Antennas, M8 to M15, 2ss
  
- 802.11n/ac - HT/VHT40 Beam Forming, Two Antennas, M0 to M7, 1ss
- 802.11n/ac - HT/VHT40 Beam Forming, Two Antennas, M8 to M15, 2ss
  
- 802.11n/ac - HT/VHT40 STBC, Two Antennas, M0 to M7, 2ss
  
- 802.11a - Non HT80, One Antenna, 6 to 54 Mbps, 1ss
- 802.11a - Non HT80, Two Antennas, 6 to 54 Mbps, 1ss
  
- 802.11ac - VHT80, One Antenna, M0 to M9 1ss
- 802.11ac - VHT80, Two Antennas, M0 to M9 1ss
- 802.11ac - VHT80, Two Antennas, M0 to M9 2ss
  
- 802.11ac - VHT80 Beam Forming, Two Antennas, M0 to M9 1ss
- 802.11ac - VHT80 Beam Forming, Two Antennas, M0 to M9 2ss
  
- 802.11ac - VHT80 STBC, Two Antennas, M0 to M9 2ss

The following antennas are supported by this product series.

The data included in this report represent the worst case data for all antennas.

| Frequency   | Part Number  | Antenna Type | Antenna Gain (dBi) |
|-------------|--------------|--------------|--------------------|
| 2.4 / 5 GHz | 2x2 Internal | AP Omni      | 2 / 4              |

### Section 3: Result Summary

#### 3.1 Results Summary Table

##### Conducted emissions

| Basic Standard             | Technical Requirements / Details   | Result |
|----------------------------|--|--------|
| 15.407                     | <p><b>99% &amp; 26 dB Bandwidth:</b><br/>The 99% occupied bandwidth is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers are each equal to 0.5% of the total mean power of the given emission. There is no limit for 99% OBW.</p> <p>The 26 dB emission is the width of the emission that is constrained by the frequencies associated with the two outermost amplitude points (upper and lower frequencies) that are attenuated by 26 dB relative to the maximum level measured in the fundamental emission.</p> | Pass   |
| 15.407                     | <p><b>Output Power:</b><br/>For the 5.25-5.35 GHz and 5.47-5.725 GHz bands, the maximum conducted output power over the frequency bands of operation shall not exceed the lesser of 250 mW or <math>11 \text{ dBm} + 10 \log B</math>, where B is the 26 dB emission bandwidth in megahertz.</p> <p>If transmitting antennas of directional gain greater than 6 dBi are used, both the maximum conducted output power and the maximum power spectral density shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.</p>            | Pass   |
| 15.407                     | <p><b>Power Spectral Density</b><br/>The maximum power spectral density shall not exceed 11 dBm in any 1 megahertz band. If transmitting antennas of directional gain greater than 6 dBi are used, both the maximum conducted output power and the maximum power spectral density shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.</p>   | Pass   |
| 15.407                     | <p><b>Conducted Spurious Emissions / Band-Edge:</b><br/>2) For transmitters operating in the 5.25-5.35 GHz band: All emissions outside of the 5.15-5.35 GHz band shall not exceed an e.i.r.p. of <math>-27 \text{ dBm/MHz}</math>.</p>   | Pass   |
| 15.407<br>15.205<br>15.209 | <p><b>Restricted band:</b><br/>Unwanted emissions must comply with the general field strength limits set forth in §15.209.</p>   | Pass   |

**Radiated Emissions (General requirements)**

| <b>Basic Standard</b>      | <b>Technical Requirements / Details</b>  | <b>Result</b> |
|----------------------------|--|---------------|
| 15.407<br>15.205<br>15.209 | <b>TX Spurious Emissions:</b><br>Except as provided elsewhere in this subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the field strength limits table in this section. | Pass          |
| 15.207                     | <b>AC conducted Emissions:</b><br>U-NII devices using an AC power line are required to comply also with the conducted limits set forth in §15.207.   | Pass          |

\* MPE calculation is recorded in a separate report

## Section 4: Sample Details

Note: Each sample was evaluated to ensure that its condition was suitable to be used as a test sample prior to the commencement of testing. Please also refer to the “Justification for worst Case test Configuration” section of this report for further details on the selection of EUT samples.

**Appendix A: Emission Test Results**

**Conducted Test Setup Diagram**

## A.1 Duty Cycle

### Duty Cycle Test Requirement

From KDB 789033 D02 General UNII Test Procedures New Rules v01r04

#### B. Duty Cycle (x), Transmission Duration (T), and Maximum Power Control Level

1. All measurements are to be performed with the EUT transmitting at 100 percent duty cycle at its maximum power control level; however, if 100 percent duty cycle cannot be achieved, measurements of duty cycle, x, and maximum-power transmission duration, T, are required for each tested mode of operation.

### Duty Cycle Test Method

From KDB 789033 D02 General UNII Test Procedures New Rules v01r04:

#### B. Duty Cycle (x), Transmission Duration (T), and Maximum Power Control Level

The zero-span mode on a spectrum analyzer or EMI receiver, if the response time and spacing between bins on the sweep are sufficient to permit accurate measurements of the on and off times of the transmitted signal. Set the center frequency of the instrument to the center frequency of the transmission. Set RBW  $\geq$  EBW if possible; otherwise, set RBW to the largest available value. Set VBW  $\geq$  RBW. Set detector = peak or average. The zero-span measurement method shall not be used unless both RBW and VBW are  $> 50/T$ , where T is defined in section II.B.1.a), and the number of sweep points across duration T exceeds 100. (For example, if VBW and/or RBW are limited to 3 MHz, then the zero-span method of measuring duty cycle shall not be used if  $T \leq 16.7$  microseconds.)

### Duty Cycle Test Information

## A.2 99% and 26dB Bandwidth

### 99% and 26dB Bandwidth Test Requirement

There is no requirement for the value of bandwidth.

However, the 26dB BW (EBW) is used to calculate the power limits in 15.407 (a) (2). Power measurements are made using the 99% Bandwidth as the integration bandwidth.

### 99% and 26dB Bandwidth Test Procedure

The 99-percent occupied bandwidth is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers are each equal to 0.5 % of the total mean power of the given emission. Measurement of the 99-percent occupied bandwidth is required only as a condition for using the optional band-edge measurement techniques described in section II.G.3.d). Measurements of 99-percent occupied bandwidth may also optionally be used in lieu of the EBW to define the minimum frequency range over which the spectrum is integrated when measuring maximum conducted output power as described in section II.E. However, the EBW must be measured to determine bandwidth dependent limits on maximum conducted output power in accordance with 15.407(a).

#### Ref. KDB 789033 Section D. 99 Percent Occupied Bandwidth

##### 99% BW

###### Test Parameters

1. Set center frequency to the nominal EUT channel center frequency.
2. Set span = 1.5 times to 5.0 times the OBW.
3. Set RBW = 1 % to 5 % of the OBW
4. Set VBW  $\geq 3 \cdot$  RBW
5. Video averaging is not permitted. Where practical, a sample detection and single sweep mode shall be used. Otherwise, peak detection and max hold mode (until the trace stabilizes) shall be used.
6. Use the 99 % power bandwidth function of the instrument (if available).

#### Ref KDB 789033 in Section C. Measurement Bandwidth, Section 1

##### 26 BW

###### Test parameters

X dB BW = -26dB (using the OBW function of the spectrum analyzer)

###### Emission Bandwidth (EBW)

- a) Set RBW = approximately 1% of the emission bandwidth.
- b) Set the VBW > RBW.
- c) Detector = Peak.
- d) Trace mode = max hold.
- e) Measure the maximum width of the emission that is 26 dB down from the maximum of the emission. Compare this with the RBW setting of the analyzer. Readjust RBW and repeat measurement as needed until the RBW/EBW ratio is approximately 1%.

## A.3 Maximum Conducted Output Power

### Maximum Conducted Output Power Test Requirement

**15.407 (2)** For the 5.25-5.35 GHz and 5.47-5.725 GHz bands, the maximum conducted output power over the frequency bands of operation shall not exceed the lesser of 250 mW or 11 dBm + 10 log B, where B is the 26 dB emission bandwidth in megahertz. ... If transmitting antennas of directional gain greater than 6 dBi are used, both the maximum conducted output power and the maximum power spectral density shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

### Maximum Conducted Output Power Test Procedure

Ref. **KDB 789033 D02 General UNII Test Procedures New Rules v01r04**  
**ANSI C63.10: 2013**

|   |
|---|
| <p><b>Maximum Conducted Output Power</b><br/> Test Procedure</p>  |
| <ol style="list-style-type: none"> <li>1. Set the radio in the continuous transmitting mode at full power</li> <li>2. Compute power by integrating the spectrum across the EBW (or alternatively entire 99% OBW) of the signal using the instrument's band power measurement function. The integration shall be performed using the spectrum analyzer band-power measurement function with band limits set equal to the EBW or the OBW band edges.</li> <li>3. Capture graphs and record pertinent measurement data.</li> </ol> |

Ref. **KDB 789033 D02 General UNII Test Procedures New Rules v01r04**  
**2. Measurement using a Spectrum Analyzer or EMI Receiver (SA), (d) Method SA-2**

|  |
|--|
| <p><b>Maximum Conducted Output Power</b><br/> Test parameters</p>  |
| <p>Method SA-2 (trace averaging across on and off times of the EUT transmissions, followed by duty cycle correction).</p> <ol style="list-style-type: none"> <li>(i) Measure the duty cycle, x, of the transmitter output signal as described in section II.B.</li> <li>(ii) Set span to encompass the EBW (or, alternatively, the entire 99% occupied bandwidth) of the signal.</li> <li>(iii) Set RBW = 1 MHz.</li> <li>(iv) Set VBW <math>\geq</math> 3 MHz.</li> <li>(v) Number of points in sweep <math>\geq</math> 2 Span / RBW. (This ensures that bin-to-bin spacing is <math>\leq</math> RBW/2, so that narrowband signals are not lost between frequency bins.)</li> <li>(vi) Sweep time = auto.</li> <li>(vii) Detector = RMS (i.e., power averaging), if available. Otherwise, use sample detector mode.</li> <li>(viii) Do not use sweep triggering. Allow the sweep to "free run".</li> <li>(ix) Trace average at least 100 traces in power averaging (i.e., RMS) mode; however, the number of traces to be averaged shall be increased above 100 as needed to ensure that the average accurately represents the true average over the on and off periods of the transmitter.</li> <li>(x) Compute power by integrating the spectrum across the EBW (or, alternatively, the entire 99% occupied bandwidth) of the signal using the instrument's band power measurement function with band limits set equal to the EBW (or occupied bandwidth)</li> </ol> |

The "measure-and-sum technique" is used for measuring in-band transmit power of a device. In the measure-and-sum approach, the conducted emission level is measured at each antenna port. The measured results at the various

antenna ports are then summed mathematically to determine the total emission level from the device. Summing is performed in linear power units. ANSI C63.10 section 14.3.2.2

Antenna A

Antenna B

## A.4 Power Spectral Density

### Power Spectral Density Test Requirement

**15.407 (2)** For the 5.25-5.35 GHz and 5.47-5.725 GHz bands ... the maximum power spectral density shall not exceed 11 dBm in any 1 megahertz band. If transmitting antennas of directional gain greater than 6 dBi are used, both the maximum conducted output power and the maximum power spectral density shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

**15.407 (5)** The maximum power spectral density is measured as a conducted emission by direct connection of a calibrated test instrument to the equipment under test. If the device cannot be connected directly, alternative techniques acceptable to the Commission may be used. Measurements in the 5.15-5.25 GHz, 5.25-5.35 GHz, and the 5.47-5.725 GHz bands are made over a bandwidth of 1 MHz or the 26 dB emission bandwidth of the device, whichever is less. A narrower resolution bandwidth can be used, provided that the measured power is integrated over the full reference bandwidth.

### Power Spectral Density Test Procedure

Ref. KDB 789033 D02 General UNII Test Procedures New Rules v01r04

#### F. Maximum Power Spectral Density (PSD)

##### Power Spectral Density

###### Test Procedure

The rules requires “maximum power spectral density” measurements where the intent is to measure the maximum value of the time average of the power spectral density measured during a period of continuous transmission.

1. Create an average power spectrum for the EUT operating mode being tested by following the instructions in section II.E.2. for measuring maximum conducted output power using a spectrum analyzer or EMI receiver: select the appropriate test method (SA-1, SA-2, SA-3, or alternatives to each) and apply it up to, but not including, the step labeled, “Compute power...”. (This procedure is required even if the maximum conducted output power measurement was performed using a power meter, method PM.)

2. Use the peak search function on the instrument to find the peak of the spectrum and record its value.

3. Make the following adjustments to the peak value of the spectrum, if applicable: a) If Method SA-2 or SA-2 Alternative was used, add  $10 \log(1/x)$ , where  $x$  is the duty cycle, to the peak of the spectrum.

b) If Method SA-3 Alternative was used and the linear mode was used in step II.E.2.g)(viii), add 1 dB to the final result to compensate for the difference between linear averaging and power averaging.

4. The result is the Maximum PSD over 1 MHz reference bandwidth.

Ref. KDB 789033 D02 General UNII Test Procedures New Rules v01r04

#### 2. Measurement using a Spectrum Analyzer or EMI Receiver (SA), (d) Method SA-2

##### Power Spectral Density

###### Test parameters

Method SA-2 (trace averaging across on and off times of the EUT transmissions, followed by duty cycle correction).

(i) Measure the duty cycle,  $x$ , of the transmitter output signal as described in section II.B.

(ii) Set span to encompass the EBW (or, alternatively, the entire 99% occupied bandwidth) of the signal.

(iii) Set RBW = 1 MHz.

(iv) Set VBW  $\geq$  3 MHz.

(v) Number of points in sweep  $\geq$  2 Span / RBW. (This ensures that bin-to-bin spacing is  $\leq$  RBW/2, so that narrowband signals are not lost between frequency bins.)

- (vi) Sweep time = auto.  
 (vii) Detector = RMS (i.e., power averaging), if available. Otherwise, use sample detector mode.  
 (viii) Do not use sweep triggering. Allow the sweep to “free run”.  
 (ix) Trace average at least 100 traces in power averaging (i.e., RMS) mode; however, the number of traces to be averaged shall be increased above 100 as needed to ensure that the average accurately represents the true average over the on and off periods of the transmitter.  
 (x) Compute power by integrating the spectrum across the EBW (or, alternatively, the entire 99% occupied bandwidth) of the signal using the instrument’s band power measurement function with band limits set equal to the EBW (or occupied bandwidth)
- F. Maximum Power Spectral Density (PSD)**
- Use the peak search function on the instrument to find the peak of the spectrum and record its value.
  - Make the following adjustments to the peak value of the spectrum, if applicable: a) If Method SA-2 or SA-2 Alternative was used, add  $10 \log(1/x)$ , where  $x$  is the duty cycle, to the peak of the spectrum.

The “measure-and-sum technique” is used for measuring in-band transmit power of a device. In the measure-and-sum approach, the conducted emission level is measured at each antenna port. The measured results at the various antenna ports are then summed mathematically to determine the total emission level from the device. Summing is performed in linear power units. ANSI C63.10 section 14.3.2.2

## A.5 Conducted Spurious Emissions

### Conducted Spurious Emissions Test Requirement

**15.407(b) Undesirable emission limits.** Except as shown in paragraph (b)(7) of this section, the maximum emissions outside of the frequency bands of operation shall be attenuated in accordance with the following limits:

- (2) For transmitters operating in the 5.25-5.35 GHz band: All emissions outside of the 5.15-5.35 GHz band shall not exceed an e.i.r.p. of -27 dBm/MHz.
- (6) Unwanted emissions below 1 GHz must comply with the general field strength limits set forth in §15.209.
- (7) The provisions of §15.205 apply to intentional radiators operating under this section.

Use formula below to substitute conducted measurements in place of radiated measurements

$$E[\text{dB}\mu\text{V}/\text{m}] = \text{EIRP}[\text{dBm}] - 20 \log(d[\text{meters}]) + 104.77, \text{ where } E = \text{field strength and } d = 3 \text{ meter}$$

- 1) Average Plot, Limit= -41.25 dBm eirp
- 2) Peak plot, Limit = -21.25 dBm eirp

### Conducted Spurious Emissions Test Procedure

**Ref. 789033 D02 General UNII Test Procedures New Rules v01r04**  
ANSI C63.10: 2013

#### Conducted Spurious Emissions

##### Test Procedure

1. Connect the antenna port(s) to the spectrum analyzer input.
2. Place the radio in continuous transmit mode. Use the procedures in KDB 789033 D02 General UNII Test Procedures New Rules v01r04 to substitute conducted measurements in place of radiated measurements.
3. Configure Spectrum analyzer as per test parameters below (be sure to enter all losses between the transmitter output and the spectrum analyzer).
4. Record the marker waveform peak to spur difference. Also measure any emissions in the restricted bands..
5. The “measure-and-sum technique” is used for measuring in-band transmit power of a device. In the measure-and-sum approach, the conducted emission level is measured at each antenna port. The measured results at the various antenna ports are then summed mathematically to determine the total emission level from the device. Summing is performed in linear power units. The worst case output is recorded.
6. Place a marker at the end of the restricted band closest to the transmit frequency to show compliance. Also measure any emissions in the restricted bands
7. Capture graphs and record pertinent measurement data.

## A.6 Conducted Band Edge

### Conducted Band Edge Test Requirement

**15.407(b) Undesirable emission limits.** Except as shown in paragraph (b)(7) of this section, the maximum emissions outside of the frequency bands of operation shall be attenuated in accordance with the following limits:

- (2) For transmitters operating in the 5.25-5.35 GHz band: All emissions outside of the 5.15-5.35 GHz band shall not exceed an e.i.r.p. of -27 dBm/MHz.
- (6) Unwanted emissions below 1 GHz must comply with the general field strength limits set forth in §15.209.
- (7) The provisions of §15.205 apply to intentional radiators operating under this section.
- (8) When measuring the emission limits, the nominal carrier frequency shall be adjusted as close to the upper and lower frequency band edges as the design of the equipment permits.

#### KDB 789033 D02 General UNII Test Procedures New Rules v01r04

##### 2. Unwanted Emissions that fall Outside of the Restricted Bands

As specified in § 15.407(b), emissions above 1000 MHz that are outside of the restricted bands are subject to a maximum emission limit of -27 dBm/MHz (or -17 dBm/MHz as specified in § 15.407(b)(4)). However, an out-of-band emission that complies with both the peak and average limits of § 15.209 is not required to satisfy the -27 dBm/MHz or -17 dBm/MHz maximum emission limit.

### Conducted Band Edge Test Procedure

#### Ref. 789033 D02 General UNII Test Procedures New Rules v01r04

ANSI C63.10: 2013

#### Conducted Spurious Emissions

##### Test Procedure

1. Connect the antenna port(s) to the spectrum analyzer input.
2. Place the radio in continuous transmit mode. Use the procedures in KDB 789033 D02 General UNII Test Procedures New Rules v01r04 to substitute conducted measurements in place of radiated measurements.
3. Configure Spectrum analyzer as per test parameters below (be sure to enter all losses between the transmitter output and the spectrum analyzer).
4. Record the marker. Also measure any emissions in the restricted bands.
5. The “measure-and-sum technique” is used for measuring in-band transmit power of a device. In the measure-and-sum approach, the conducted emission level is measured at each antenna port. The measured results at the various antenna ports are then summed mathematically to determine the total emission level from the device. Summing is performed in linear power units. The worst case output is recorded.
6. Place a marker at the end of the restricted band closest to the transmit frequency to show compliance. Also measure any emissions in the restricted bands
7. Capture graphs and record pertinent measurement data.

**Appendix B: Emission Test Results**

Testing Laboratory: Cisco Systems, Inc., 125 West Tasman Drive, San Jose, CA 95134, USA

**Radiated Emission Setup Diagram-Below 1G**

**Radiated Emission Setup Diagram-Above 1G**

## B.1 Radiated Spurious Emissions

### Radiated Spurious Emissions Test Requirement

**15.407(b) Undesirable emission limits.** Except as shown in paragraph (b)(7) of this section, the maximum emissions outside of the frequency bands of operation shall be attenuated in accordance with the following limits:

(2) For transmitters operating in the 5.25-5.35 GHz band: All emissions outside of the 5.15-5.35 GHz band shall not exceed an e.i.r.p. of -27 dBm/MHz.

#### 15.205 / 15.209

(7) The provisions of §15.205 apply to intentional radiators operating under this section.

(8) When measuring the emission limits, the nominal carrier frequency shall be adjusted as close to the upper and lower frequency band edges as the design of the equipment permits

**Ref.** ANSI C63.10: 2013 Section 12.7.6 (Peak), Section 12.7.7.2 (Method AD), and Section 6.6

Using Vasona, configure the spectrum analyzer as shown below (be sure to enter all losses between the transmitter output and the spectrum analyzer). Place the radio in continuous transmit mode.

| <b>Radiated Spurious Emissions</b>   |  |
|--|--|
| Test parameters  |  |
| <b>Peak</b><br>Span = 1-18GHz /18GHz-26.5GHz/26.5GHz-40GHz<br>RBW = 1 MHz<br>VBW $\geq$ 3 MHz<br>Sweep = Auto couple<br>Detector = Peak<br>Trace = Max Hold. | <b>Average</b><br>Span = 1-18GHz /18GHz-26.5GHz/26.5GHz-40GHz<br>RBW = 1 MHz<br>VBW $\geq$ 3 MHz<br>Sweep = Auto couple<br>Detector = RMS<br>Power Averaging |

Terminate the access Point RF ports with 50 ohm loads.

Maximize Turntable (find worst case table angle), Maximize Antenna (find worst case height)

Save 2 plots:    1) Average Plot (Vertical and Horizontal), Limit= 54dBuV/m @3m  
                      2) Peak plot (Vertical and Horizontal), Limit = 74dBuV/m @3m

Place a marker at the end of the restricted band closest to the transmit frequency to show compliance.  
 Also measure any emissions in the restricted bands.

This report represents the worst case data for all supported operating modes and antennas. There were no spurious emissions in the range 1-18GHz. Please note, the emission at 1.377GHz was investigated and was not caused by the radio. The emission was present when the radio was not transmitting. There were no significant emissions above 18GHz.

**Tested By :**

Johanna Knudsen

**Date of testing:**

July 26, 2017 – July 26, 2017

**Test Result : PASS****Test Equipment**

See Appendix C for list of test equipment

### B.1.A Transmitter Radiated Spurious Emissions-Average

This report represents the worst case data for all supported operating modes and antennas. There were no spurious emissions in the range 1-18GHz. Please note, the emission at 1.377GHz was investigated and was not caused by the radio. The emission was present when the radio was not transmitting.

#### B.1.A.1 Radiated Transmitter Spurs, 5260 MHz, 6 to 54 Mbps, Average (1-18GHz)

**B.1.A.2 Radiated Transmitter Spurs, 5280 MHz, 6 to 54 Mbps, Average (1-18GHz)**

**B.1.A.3 Radiated Transmitter Spurs, 5320 MHz, 6 to 54 Mbps, Average (1-18GHz)**

There were no significant emissions above 18GHz.

**B.1.A.5 Radiated Transmitter Spurs, All rate, All modes, Average (18GHz – 26.5GHz) Horizontal & Vertical**

**B.1.A.6 Radiated Transmitter Spurs, All rate, All modes, Average (26.5GHz – 40GHz) Horizontal & Vertical**

### B.1.P Transmitter Radiated Spurious Emissions-Peak

This report represents the worst case data for all supported operating modes and antennas. There were no spurious emissions in the range 1-18GHz. Please note, the emission at 1.377GHz was investigated and was not caused by the radio. The emission was present when the radio was not transmitting.

#### B.1.P.1 Radiated Transmitter Spurs, 5260 MHz, 6 to 54 Mbps, Peak (1-18GHz)

**B.1.P.2 Radiated Transmitter Spurs, 5280 MHz, 6 to 54 Mbps, Peak (1-18GHz)**

**B.1.P.3 Radiated Transmitter Spurs, 5320 MHz, 6 to 54 Mbps, Peak (1-18GHz)**

There were no significant emissions above 18GHz.

**B.1.P.5 Radiated Transmitter Spurs, All rate, All modes, Peak (18GHz – 26.5GHz) Horizontal & Vertical**

**B.1.P.6 Radiated Transmitter Spurs, All rate, All modes, Peak (26.5-40GHz) Vertical & Horizontal**

## B.2 Radiated Emissions 30MHz to 1GHz

### 15.205 / 15.209

(7) The provisions of §15.205 apply to intentional radiators operating under this section.

(6) Unwanted emissions below 1 GHz must comply with the general field strength limits set forth in §15.209.

**Ref.** ANSI C63.10: 2013 section 12.7 sec 6.5

Using Vasona, configure the spectrum analyzer as shown below (be sure to enter all losses between the transmitter output and the spectrum analyzer). Place the radio in continuous transmit mode.

Span: 30MHz – 1GHz  
 Reference Level: 80 dBuV  
 Attenuation: 10 dB  
 Sweep Time: Coupled  
 Resolution Bandwidth: 100kHz  
 Video Bandwidth: 300kHz  
 Detector: Quasi-Peak

Terminate the access Point RF ports with 50 ohm loads.

Maximize Turntable (find worst case table angle), Maximize Antenna (find worst case height)

This report represents the worst case data for all supported operating modes and antennas.

## B.3 AC Conducted Emissions

### FCC 15.207 (a)

Except when the requirements applicable to a given device state otherwise, for any radio apparatus equipped to operate from the public utility AC power supply, either directly or indirectly (such as with a battery charger), the radio frequency voltage of emissions conducted back onto the AC power lines in the frequency range of 0.15 MHz to 30 MHz shall not exceed the limits shown in the table in these sections. The more stringent limit applies at the frequency range boundaries.

### Measurement Procedure

Accordance with ANSI C64.10:2013 section 6.2

Using Vasona, configure the spectrum analyzer as shown below (be sure to enter all losses between the transmitter output and the spectrum analyzer). Place the radio in continuous transmit mode.

|                       |                      |
|-----------------------|----------------------|
| Span:                 | 150 KHz – 30 MHz     |
| Attenuation:          | 10 dB                |
| Sweep Time:           | Coupled              |
| Resolution Bandwidth: | 9 KHz                |
| Video Bandwidth:      | 30 KHz               |
| Detector:             | Quasi-Peak / Average |

### Samples, Systems, and Modes

## Appendix D: Abbreviation Key and Definitions

The following table defines abbreviations used within this test report.

| Abbreviation | Description  | Abbreviation | Description                         |
|--------------|--|--------------|-------------------------------------|
| EMC          | Electro Magnetic Compatibility                                       | °F           | Degrees Fahrenheit                  |
| EMI          | Electro Magnetic Interference  | °C           | Degrees Celsius                     |
| EUT          | Equipment Under Test   | Temp         | Temperature                         |
| ITE          | Information Technology Equipment                                     | S/N          | Serial Number                       |
| TAP          | Test Assessment Schedule   | Qty          | Quantity                            |
| ESD          | Electro Static Discharge   | emf          | Electromotive force                 |
| EFT          | Electric Fast Transient  | RMS          | Root mean square                    |
| EDCS         | Engineering Document Control System                                  | Qp           | Quasi Peak                          |
| Config       | Configuration  | Av           | Average                             |
| CIS#         | Cisco Number (unique identification number for Cisco test equipment) | Pk           | Peak                                |
| Cal          | Calibration  | kHz          | Kilohertz ( $1 \times 10^3$ )       |
| EN           | European Norm  | MHz          | MegaHertz ( $1 \times 10^6$ )       |
| IEC          | International Electro technical Commission                           | GHz          | Gigahertz ( $1 \times 10^9$ )       |
| CISPR        | International Special Committee on Radio Interference                | H            | Horizontal                          |
| CDN          | Coupling/Decoupling Network  | V            | Vertical                            |
| LISN         | Line Impedance Stabilization Network                                 | dB           | decibel                             |
| PE           | Protective Earth   | V            | Volt                                |
| GND          | Ground   | kV           | Kilovolt ( $1 \times 10^3$ )        |
| L1           | Line 1   | $\mu$ V      | Microvolt ( $1 \times 10^{-6}$ )    |
| L2           | Line2  | A            | Amp                                 |
| L3           | Line 3   | $\mu$ A      | Micro Amp ( $1 \times 10^{-6}$ )    |
| DC           | Direct Current   | mS           | Milli Second ( $1 \times 10^{-3}$ ) |
| RAW          | Uncorrected measurement value, as indicated by the measuring device  | $\mu$ S      | Micro Second ( $1 \times 10^{-6}$ ) |
| RF           | Radio Frequency  | $\mu$ S      | Micro Second ( $1 \times 10^{-6}$ ) |
| SLCE         | Signal Line Conducted Emissions                                      | m            | Meter                               |
| Meas dist    | Measurement distance   | Spec dist    | Specification distance              |
| N/A or NA    | Not Applicable   | SL           | Signal Line (or Telecom Line)       |
| P            | Power Line   | L            | Live Line                           |
| N            | Neutral Line   | R            | Return                              |
| S            | Supply   | AC           | Alternating Current                 |

## **Appendix F: Software Used to Perform Testing**

TS8997 Test System, Software: WMS32 version 10.20

Radiated Spurious Emissions, Conducted Spurious Emissions, Software: EMIsoft Vasona, version 6.031

Conducted Power, Bandwidth, PSD: RF Automation Main

## **Appendix G: Test Procedures**

Measurements were made in accordance with

- KDB 789033 - D02 General UNII Test Procedures New Rules v01r04
- KDB 662911 - MIMO
- ANSI C63.4 2014 Unintentional Radiators
- ANSI C63.10 2013 Intentional Radiators

Test procedures are summarized below:

|                              |                |
|------------------------------|----------------|
| FCC 5GHz Test Procedures     | EDCS # 1445048 |
| FCC 5GHz RSE Test Procedures | EDCS # 1511600 |

**Appendix H: Scope of Accreditation (A2LA certificate number 1178-01)**

The scope of accreditation of Cisco Systems, Inc. can be found on the A2LA web page at:

<http://www.a2la.org/scopepdf/1178-01.pdf>

## **Appendix I: Test Assessment Plan**

Compliance Test Plan (Excel) EDCS# 11811301

Target Power Tables EDCS# 11759869

## **Appendix J: Worst Case Justification**

Test modes were determined from the Compliance Test Plan EDCS# 11811301.

All formal data can be found in EDCS# 11811303.
