2.5 MPE Calculation Method

The MPE was calculated at 100 cm to show compliance with the power density limit.

The following formula was used to calculate the Power Density:

$$E \text{ (V/m)} = \frac{\sqrt{30 \xi P \xi G}}{d} \qquad \text{Power Density: } Pd \text{ (W/m}^2\text{)} = \frac{E^2}{377}$$

E = Electric field (V/m)

P = RF output power (W)

G = EUT Antenna numeric gain (numeric)

d = Separation distance between radiator and human body (m)

The formula can be changed to

$$Pd = \frac{30 \xi P \xi G}{377 \xi d^2}$$

2.7 Calculations with additional transmitters

The FCC's MPE limits vary with frequency. Therefore, in mixed or broadband RF fields where several sources and frequencies are involved, the fraction of the recommended limit (in terms of power density or square of the electric or magnetic field strength) incurred within each frequency interval should be determined, and the sum of all fractional contributions should not exceed 1.0, or 100% in terms of percentage.

Worst Case Scenario:

BLE (Highest power) – 13dBm

5GHz Radio 1 – 34.50dBm

5GHz Radio 2 – 35.50dBm or 6GHz Radio 2 – 30.50dBm

Total Power Densities (Percentages) = 5GHz Radio 1 Power Density % + 5GHz Radio 2 Power Density % +
BLE Power Density % + 4.9GHz Radio 1

Total Relative Power Densities (Percentages) = $(0.106/1.0) * 100 + (0.197/1.0) * 100 + (0.001/1) * 100 +$
 $(0.056/1.0) * 100 =$
 $= 10.6 \% + 19.7 \% + 1\% + 5.6 \%$
 $= 36.9\%$
