MAXIMUM PERMISSIBLE EXPOSURE FOR SUBPART C 2.4 GHz BAND

Calculations

Power density at the specific separation:

$S = PG/(4R^2\pi)$
$S = (0.4943 * 1.472) / (4 * 1^2 * \pi)$
$S = 0.0579013322$ mW/cm^2 (at 1 cm)
Limit = 1 mW/cm^2

where

S = Maximum power density (mW/cm^2)
P = Power input to the antenna (mW) – (-3.06) dBm
G = Numeric power gain of the antenna
R = distance to the center of the radiation of the antenna (1 cm = limit for MPE)

The maximum permissible exposure (MPE) for the general population is 1 mW/cm^2.

The power density at 1 cm does not exceed the 1 mW/cm^2. Therefore, the exposure condition is compliant with FCC rules.

The numeric gain (G) of the antenna with a gain specified in dB is determined by:

$G = Log^{-1}$ (dB antenna gain/10)
$G = Log^{-1}$ (1.68 dBi/10)
G = 1.472
